This document describes the Process Management Interface for Exascale (PMIx) Standard, version 2.0.

Comments: Please provide comments on the PMIx Standard by filing issues on the document repository https://github.com/pmix/pmix-standard/issues or by sending them to the PMIx Community mailing list at https://groups.google.com/forum/#!forum/pmix. Comments should include the version of the PMIx standard you are commenting about, and the page, section, and line numbers that you are referencing. Please note that messages sent to the mailing list from an unsubscribed e-mail address will be ignored.

Introduction

The Process Management Interface (PMI) has been used for quite some time as a means of exchanging wireup information needed for inter-process communication. Two versions (PMI-1 and PMI-2) have been released as part of the MPICH effort, with PMI-2 demonstrating better scaling properties than its PMI-1 predecessor. However, two significant challenges face the High Performance Computing (HPC) community as it continues to move towards machines capable of exaflop and higher performance levels:

- the physical scale of the machines, and the corresponding number of total processes they support, is expected to reach levels approaching 1 million processes executing across 100 thousand nodes. Prior methods for initiating applications relied on exchanging communication endpoint information between the processes, either directly or in some form of hierarchical collective operation. Regardless of the specific mechanism employed, the exchange across such large applications would consume considerable time, with estimates running in excess of 5-10 minutes; and

- whether it be hybrid applications that combine OpenMP threading operations with MPI, or application-steered workflow computations, the HPC community is experiencing an unprecedented wave of new approaches for computing at exascale levels. One common thread across the proposed methods is an increasing need for orchestration between the application and the system management software stack (SMS) comprising the scheduler (a.k.a. the workload manager (WLM)), the resource manager (RM), global file system, fabric, and other subsystems. The lack of available support for application-to-SMS integration has forced researchers to develop "virtual" environments that hide the SMS behind a customized abstraction layer, but this results in considerable duplication of effort and a lack of portability.

Process Management Interface - Exascale (PMIx) represents an attempt to resolve these questions by providing an extended version of the PMI definitions specifically designed to support clusters up to exascale and larger sizes. The overall objective of the project is not to branch the existing definitions – in fact, PMIx fully supports both of the existing PMI-1 and PMI-2 Application Programming Interfaces (APIs) – but rather to:

a) add flexibility to the existing APIs by adding an array of key-value “attribute” pairs to each API signature that allows implementers to customize the behavior of the API as future needs emerge without having to alter or create new variants of it;

b) add new APIs that provide extended capabilities such as asynchronous event notification plus dynamic resource allocation and management;
c) establish a collaboration between SMS subsystem providers including resource manager, fabric, file system, and programming library developers to define integration points between the various subsystems as well as agreed upon definitions for associated APIs, attribute names, and data types;

d) form a standards-like body for the definitions; and

e) provide a reference implementation of the PMIx standard.

Complete information about the PMIx standard and affiliated projects can be found at the PMIx web site: https://pmix.org

1.1 Charter

The charter of the PMIx community is to:

• Define a set of agnostic APIs (not affiliated with any specific programming model or code base) to support interactions between application processes and the SMS.

• Develop an open source (non-copy-left licensed) standalone “reference” library implementation to facilitate adoption of the PMIx standard.

• Retain transparent backward compatibility with the existing PMI-1 and PMI-2 definitions, any future PMI releases, and across all PMIx versions.

• Support the “Instant On” initiative for rapid startup of applications at exascale and beyond.

• Work with the HPC community to define and implement new APIs that support evolving programming model requirements for application interactions with the SMS.

Participation in the PMIx community is open to anyone, and not restricted to only code contributors to the reference implementation.

1.2 PMIx Standard Overview

The PMIx Standard defines and describes the interface developed by the PMIx Reference Implementation (PRI). Much of this document is specific to the PMIx Reference Implementation (PRI)’s design and implementation. Specifically the standard describes the functionality provided by the PRI, and what the PRI requires of the clients and resource managers (RMs) that use it’s interface.
1.2.1 Who should use the standard?

The PMIx Standard informs PMIx clients and RMs of the syntax and semantics of the PMIx APIs. PMIx clients (e.g., tools, Message Passing Environment (MPE) libraries) can use this standard to understand the set of attributes provided by various APIs of the PRI and their intended behavior. Additional information about the rationale for the selection of specific interfaces and attributes is also provided.

PMIx-enabled RMs can use this standard to understand the expected behavior required of them when they support various interfaces/attributes. In addition, optional features and suggestions on behavior are also included in the discussion to help guide RM design and implementation.

1.2.2 What is defined in the standard?

The PMIx Standard defines and describes the interface developed by the PMIx Reference Implementation (PRI). It defines the set of attributes that the PRI supports; the set of attributes that are required of a RM to support, for a given interface; and the set of optional attributes that an RM may choose to support, for a given interface.

1.2.3 What is not defined in the standard?

No standards body can require an implementer to support something in their standard, and PMIx is no different in that regard. While an implementer of the PMIx library itself must at least include the standard PMIx headers and instantiate each function, they are free to return “not supported” for any function they choose not to implement.

This also applies to the host environments. Resource managers and other system management stack components retain the right to decide on support of a particular function. The PMIx community continues to look at ways to assist SMS implementers in their decisions by highlighting functions that are critical to basic application execution (e.g., PMIx_Get), while leaving flexibility for tailoring a vendor’s software for their target market segment.

One area where this can become more complicated is regarding the attributes that provide information to the client process and/or control the behavior of a PMIx standard API. For example, the PMIX_TIMEOUT attribute can be used to specify the time (in seconds) before the requested operation should time out. The intent of this attribute is to allow the client to avoid “hanging” in a request that takes longer than the client wishes to wait, or may never return (e.g., a PMIx_Fence that a blocked participant never enters).

If an application (for example) truly relies on the PMIX_TIMEOUT attribute in a call to PMIx_Fence, it should set the required flag in the pmix_info_t for that attribute. This informs the library and its SMS host that it must return an immediate error if this attribute is not
supported. By not setting the flag, the library and SMS host are allowed to treat the attribute as
optional, ignoring it if support is not available.

It is therefore critical that users and application implementers:

1. consider whether or not a given attribute is required, marking it accordingly; and
2. check the return status on all PMIx function calls to ensure support was present and that the
   request was accepted. Note that for non-blocking APIs, a return of `PMIX_SUCCESS` only
   indicates that the request had no obvious errors and is being processed – the eventual callback
   will return the status of the requested operation itself.

While a PMIx library implementer, or an SMS component server, may choose to support a
particular PMIx API, they are not required to support every attribute that might apply to it. This
would pose a significant barrier to entry for an implementer as there can be a broad range of
applicable attributes to a given API, at least some of which may rarely be used. The PMIx
community is attempting to help differentiate the attributes by indicating those that are generally
used (and therefore, of higher importance to support) vs those that a “complete implementation”
would support.

Note that an environment that does not include support for a particular attribute/API pair is not
“incomplete” or of lower quality than one that does include that support. Vendors must decide
where to invest their time based on the needs of their target markets, and it is perfectly reasonable
for them to perform cost/benefit decisions when considering what functions and attributes to
support.

The flip side of that statement is also true: Users who find that their current vendor does not support
a function or attribute they require may raise that concern with their vendor and request that the
implementation be expanded. Alternatively, users may wish to utilize the PMIx-based Reference
RunTime Environment (PRRTE) as a “shim” between their application and the host environment as
it might provide the desired support until the vendor can respond. Finally, in the extreme, one can
exploit the portability of PMIx-based applications to change vendors.

1.2.4 General Guidance for PMIx Users and Implementors

The PMIx Standard defines the behavior of the PMIx Reference Implementation (PRI). A complete
system harnessing the PMIx interface requires an agreement between the PMIx client, be it a tool or
library, and the PMIx-enabled RM. The PRI acts as an intermediary between these two entities by
providing a standard API for the exchange of requests and responses. The degree to which the
PMIx client and the PMIx-enabled RM may interact needs to be defined by those developer
communities. The PMIx standard can be used to define the specifics of this interaction.

PMIx clients (e.g., tools, MPE libraries) may find that they depend only on a small subset of
interfaces and attributes to work correctly. PMIx clients are strongly advised to define a document
itemizing the PMIx interfaces and associated attributes that are required for correct operation, and
are optional but recommended for full functionality. The PMIx standard cannot define this list for
all given PMIx clients, but such a list is valuable to RMs desiring to support these clients.
PMIx-enabled RMs may choose to implement a subset of the PMIx standard and/or define attributes beyond those defined herein. PMIx-enabled RMs are strongly advised to define a document itemizing the PMIx interfaces and associated attributes they support, with any annotations about behavior limitations. The PMIx standard cannot define this list for all given PMIx-enabled RMs, but such a list is valuable to PMIx clients desiring to support a broad range of PMIx-enabled RMs.

1.3 PMIx Architecture Overview

This section presents a brief overview of the PMIx Architecture [1]. Note that this is a conceptual model solely used to help guide the standards process — it does not represent a design requirement on any PMIx implementation. Instead, the model is used by the PMIx community as a sounding board for evaluating proposed interfaces and avoid unintentionally imposing constraints on implementers. Built into the model are two guiding principles also reflected in the standard. First, PMIx operates in the mode of a messenger, and not a doer — i.e., the role of PMIx is to provide communication between the various participants, relaying requests and returning responses. The intent of the standard is not to suggest that PMIx itself actually perform any of the defined operations — this is left to the various SMS elements and/or the application. Any exceptions to that intent are left to the discretion of the particular implementation.

Thus, as the diagram in Fig. 1.1 shows, the application is built against a PMIx client library that contains the client-side APIs, attribute definitions, and communication support for interacting with the local PMIx server. Intra-process cross-library interactions are supported at the client level to avoid unnecessary burdens on the server. Orchestration requests are sent to the local PMIx server, which subsequently passes them to the host SMS (here represented by an RM daemon) using the

Figure 1.1.: PMIx-SMS Interactions
PMIx server callback functions the host SMS registered during PMIx_server_init. The host SMS can indicate its lack of support for any operation by simply providing a NULL for the associated callback function, or can create a function entry that returns not supported when called.

The conceptual model places the burden of fulfilling the request on the host SMS. This includes performing any inter-node communications, or interacting with other SMS elements. Thus, a client request for a network traffic report does not go directly from the client to the Fabric Manager (FM), but instead is relayed to the PMIx server, and then passed to the host SMS for execution. This architecture reflects the second principle underlying the standard — namely, that connectivity is to be minimized by channeling all application interactions with the SMS through the local PMIx server.

Recognizing the burden this places on SMS vendors, the PMIx community has included interfaces by which the host can request support from local SMS elements. Once the SMS has transferred the request to an appropriate location, a PMIx server interface can be used to pass the request between SMS subsystems. For example, a request for network traffic statistics can utilize the PMIx networking abstractions to retrieve the information from the FM. This reduces the portability and interoperability issues between the individual subsystems by transferring the burden of defining the interoperable interfaces from the SMS subsystems to the PMIx community, which continues to work with those providers to develop the necessary support.

Tools, whether standalone or embedded in job scripts, are an exception to the communication rule and can connect to any PMIx server providing they are given adequate rendezvous information. The PMIx conceptual model views the collection of PMIx servers as a cloud-like conglomerate — i.e., orchestration and information requests can be given to any server regardless of location. However, tools frequently execute on locations that may not house an operating PMIx server — e.g., a users notebook computer. Thus, tools need the ability to remotely connect to the PMIx server “cloud”.

The scope of the PMIx standard therefore spans the range of these interactions, between client-and-SMS and between SMS subsystems. Note again that this does not impose a requirement on any given PMIx implementation to cover the entire range — implementers are free to return not supported from any PMIx function.

### 1.3.1 The PMIx Reference Implementation (PRI)

The PMIx community has committed to providing a complete, reference implementation of each version of the standard. Note that the definition of the PMIx Standard is not contingent upon use of the PMIx Reference Implementation (PRI) — any implementation that supports the defined APIs is a PMIx Standard compliant implementation. The PRI is provided solely for the following purposes:

- Validation of the standard.
  No proposed change and/or extension to the PMIx standard is accepted without an accompanying prototype implementation in the PRI. This ensures that the proposal has undergone at least some minimal level of scrutiny and testing before being considered.
• Ease of adoption.

The PRI is designed to be particularly easy for resource managers (and the SMS in general) to adopt, thus facilitating a rapid uptake into that community for application portability. Both client and server PMIx libraries are included, along with examples of client usage and server-side integration. A list of supported environments and versions is maintained on the PMIx web site https://pmix.org/support/faq/what-apis-are-supported-on-my-rm/

The PRI does provide some internal implementations that lie outside the scope of the PMIx standard. This includes several convenience macros as well as support for consolidating collectives for optimization purposes (e.g., the PMIx server aggregates all local PMIx_Fence calls before passing them to the SMS for global execution). In a few additional cases, the PMIx community (in partnership with the SMS subsystem providers) have determined that a base level of support for a given operation can best be portably provided by including it in the PRI.

Instructions for downloading, and installing the PRI are available on the community’s web site https://pmix.org/code/getting-the-reference-implementation/. The PRI targets support for the Linux operating system. A reasonable effort is made to support all major, modern Linux distributions; however, validation is limited to the most recent 2-3 releases of RedHat Enterprise Linux (RHEL), Fedora, CentOS, and SUSE Linux Enterprise Server (SLES). In addition, development support is maintained for Mac OSX. Production support for vendor-specific operating systems is included as provided by the vendor.

1.3.2 The PMIx Reference RunTime Environment (PRRTE)

The PMIx community has also released PRRTE — i.e., a runtime environment containing the reference implementation and capable of operating within a host SMS. PRRTE provides an easy way of exploring PMIx capabilities and testing PMIx-based applications outside of a PMIx-enabled environment by providing a “shim” between the application and the host environment that includes full support for the PRI. The intent of PRRTE is not to replace any existing production environment, but rather to enable developers to work on systems that do not yet feature a PMIx-enabled host SMS or one that lacks a PMIx feature of interest. Instructions for downloading, installing, and using PRRTE are available on the community’s web site https://pmix.org/code/getting-the-pmix-reference-server/

1.4 Organization of this document

The remainder of this document is structured as follows:

• Introduction and Overview in Chapter 1 on page 1
• Terms and Conventions in Chapter 2 on page 10
• Data Structures and Types in Chapter 3 on page 15
1.5 Version 1.0: June 12, 2015

The PMIx version 1.0 *ad hoc* standard was defined in the PMIx Reference Implementation (PRI) header files as part of the PRI v1.0.0 release prior to the creation of the formal PMIx 2.0 standard. Below are a summary listing of the interfaces defined in the 1.0 headers.

- **Client APIs**
  - PMIx_Init, PMIx_Initialized, PMIx_Abort, PMIx_Finalize
  - PMIx_Put, PMIx_Commit,
  - PMIx_Fence, PMIx_Fence_nb
  - PMIx_Get, PMIx_Get_nb
  - PMIx_Publish, PMIx_Publish_nb
  - PMIx_Lookup, PMIx_Lookup
  - PMIx_Unpublish, PMIx_Unpublish_nb
  - PMIx_Spawn, PMIx_Spawn_nb
  - PMIx_Connect, PMIx_Connect_nb
  - PMIx_Disconnect, PMIx_Disconnect_nb
  - PMIx_Resolve_nodes, PMIx_Resolve_peers

- **Server APIs**
  - PMIx_server_init, PMIx_server_finalize
  - PMIx_generate_regex, PMIx_generate_ppn
  - PMIx_server_register_nspace, PMIx_server_deregister_nspace
  - PMIx_server_register_client, PMIx_server_deregister_client
- `PMIx_server_setup_fork`, `PMIx_server_dmodex_request`

- **Common APIs**
  - `PMIx_Get_version`, `PMIx_Store_internal`, `PMIx_Error_string`
  - `PMIx_Register_errhandler`, `PMIx_Deregister_errhandler`, `PMIx_Notify_error`

The `PMIx_Init` API was subsequently modified in the PRI release v1.1.0.

### 1.6 Version 2.0: Sept. 2018

The following APIs were introduced in v2.0 of the PMIx Standard:

- **Client APIs**
  - `PMIx_Query_info_nb`, `PMIx_Log_nb`
  - `PMIx_Allocation_request_nb`, `PMIx_Job_control_nb`, `PMIx_Process_monitor_nb`, `PMIx_Heartbeat`

- **Server APIs**
  - `PMIx_server_setup_application`, `PMIx_server_setup_local_support`

- **Tool APIs**
  - `PMIx_tool_init`, `PMIx_tool_finalize`

- **Common APIs**
  - `PMIx_Register_event_handler`, `PMIx_Deregister_event_handler`
  - `PMIx_Notify_event`
  - `PMIx_Proc_state_string`, `PMIx_Scope_string`
  - `PMIx_Persistence_string`, `PMIx_Data_range_string`
  - `PMIx_Info_directives_string`, `PMIx_Data_type_string`
  - `PMIx_Alloc_directive_string`
  - `PMIx_Data_pack`, `PMIx_Data_unpack`, `PMIx_Data_copy`
  - `PMIx_Data_print`, `PMIx_Data_copy_payload`

The `PMIx_Init` API was modified in v2.0 of the standard from its *ad hoc* v1.0 signature to include passing of a `pmix_info_t` array for flexibility and “future-proofing” of the API. In addition, the `PMIx_Notify_error`, `PMIx_Register_errhandler`, and `PMIx_Deregister_errhandler` APIs were replaced.
PMIx Terms and Conventions

The PMIx Standard has adopted the widespread use of key-value attributes to add flexibility to the functionality expressed in the existing APIs. Accordingly, the community has chosen to require that the definition of each standard API include the passing of an array of attributes. These provide a means of customizing the behavior of the API as future needs emerge without having to alter or create new variants of it. In addition, attributes provide a mechanism by which researchers can easily explore new approaches to a given operation without having to modify the API itself.

The PMIx community has further adopted a policy that modification of existing released APIs will only be permitted under extreme circumstances. In its effort to avoid introduction of any such backward incompatibility, the community has avoided the definitions of large numbers of APIs that each focus on a narrow scope of functionality, and instead relied on the definition of fewer generic APIs that include arrays of directives for “tuning” the function’s behavior. Thus, modifications to the PMIx standard increasingly consist of the definition of new attributes along with a description of the APIs to which they relate and the expected behavior when used with those APIs.

One area where this can become more complicated relates to the attributes that provide directives to the client process and/or control the behavior of a PMIx standard API. For example, the PMIX_TIMEOUT attribute can be used to specify the time (in seconds) before the requested operation should time out. The intent of this attribute is to allow the client to avoid hanging in a request that takes longer than the client wishes to wait, or may never return (e.g., a PMIx_Fence that a blocked participant never enters).

If an application truly relies on the PMIX_TIMEOUT attribute in a call to PMIx_Fence, it should set the required flag in the pmix_info_t for that attribute. This informs the library and its SMS host that it must return an immediate error if this attribute is not supported. By not setting the flag, the library and SMS host are allowed to treat the attribute as optional, silently ignoring it if support is not available.

Advice to users

It is critical that users and application developers consider whether or not a given attribute is required (marking it accordingly) and always check the return status on all PMIx function calls to ensure support was present and that the request was accepted. Note that for non-blocking APIs, a return of PMIX_SUCCESS only indicates that the request had no obvious errors and is being processed. The eventual callback will return the status of the requested operation itself.
While a PMIx library implementer, or an SMS component server, may choose to support a particular PMIx API, they are not required to support every attribute that might apply to it. This would pose a significant barrier to entry for an implementer as there can be a broad range of applicable attributes to a given API, at least some of which may rarely be used in a specific market area. The PMIx community is attempting to help differentiate the attributes by indicating in the standard those that are generally used (and therefore, of higher importance to support) versus those that a “complete implementation” would support.

This document borrows freely from other standards (most notably from the Message Passing Interface (MPI) and OpenMP standards) in its use of notation and conventions in an attempt to reduce confusion. The following sections provide an overview of the conventions used throughout the PMIx Standard document.

### 2.1 Notational Conventions

Some sections of this document describe programming language specific examples or APIs. Text that applies only to programs for which the base language is C is shown as follows:

```c
int foo = 42;
```

Some text is for information only, and is not part of the normative specification. These take several forms, described in their examples below:

```markdown
Note: General text...
```

```markdown
Rationale
```

Throughout this document, the rationale for the design choices made in the interface specification is set off in this section. Some readers may wish to skip these sections, while readers interested in interface design may want to read them carefully.

```markdown
Advice to users
```

Throughout this document, material aimed at users and that illustrates usage is set off in this section. Some readers may wish to skip these sections, while readers interested in programming with the PMIx API may want to read them carefully.
2.2 Semantics

The following terms will be taken to mean:

- *shall* and *will* indicate that the specified behavior is *required* of all conforming implementations
- *should* and *may* indicate behaviors that a quality implementation would include, but are not required of all conforming implementations

In addition, the document refers to the following entities and process stages when describing use-cases or operations involving PMIx:

- *session* refers to an allocated set of resources assigned to a particular user by the system WLM.
- *job* refers to an application executed by the user within a session
- *resource manager* is used in a generic sense to represent the system that will host the PMIx server library. This could be a vendor’s RM, a programming library’s RTE, or some other agent.
2.3 Naming Conventions

The PMIx standard has adopted the following conventions:

- PMIx constants and attributes are prefixed with \texttt{PMIX}.
- Structures and type definitions are prefixed with \texttt{pmix}.
- Underscores are used to separate words in a function or variable name.
- Lowercase letters are used in PMIx client APIs except for the PMIx prefix (noted below) and the first letter of the word following it. For example, \texttt{PMIx\_Get\_version}.
- PMIx server and tool APIs are all lower case letters following the prefix - e.g., \texttt{PMIx\_server\_register\_nspace}.
- The \texttt{PMIx\_} prefix is used to denote functions.
- The \texttt{pmix\_} prefix is used to denote function pointer and type definitions.

Users should not use the \texttt{PMIX}, \texttt{PMIx}, or \texttt{pmix} prefixes in their applications or libraries so as to avoid symbol conflicts with current and later versions of the PMIx standard and implementations such as the PRI.

2.4 Procedure Conventions

While the current PMIx Reference Implementation (PRI) is solely based on the C programming language, it is not the intent of the PMIx Standard to preclude the use of other languages. Accordingly, the procedure specifications in the PMIx Standard are written in a language-independent syntax with the arguments marked as IN, OUT, or INOUT. The meanings of these are:

- IN: The call may use the input value but does not update the argument from the perspective of the caller at any time during the calls execution,
- OUT: The call may update the argument but does not use its input value
- INOUT: The call may both use and update the argument.

2.5 Standard vs Reference Implementation

The \textit{PMIx Standard} is implementation independent. The \textit{PMIx Reference Implementation} (PRI) is one implementation of the Standard and the PMIx community strives to ensure that it fully implements the Standard. Given its role as the community’s testbed and its widespread use, this document cites the attributes supported by the PRI for each API where relevant by marking them in
red. This is not meant to imply nor confer any special role to the PRI with respect to the Standard itself, but instead to provide a convenience to users of the Standard and PRI.

Similarly, the PMIx Reference RunTime Environment (PRRTE) is provided by the community to enable users operating in non-PMIx environments to develop and execute PMIx-enabled applications and tools. Attributes supported by the PRRTE are marked in green.
This chapter defines PMIx standard data structures, types, and constants. These apply to all consumers of the PMIx interface. Where necessary for clarification, the description of, for example, an attribute may be copied from this chapter into a section where it is used.

A PMIx implementation may define additional attributes beyond those specified in this document.

--- Advice to PMIx library implementers ---

Structures, types, and macros in the PMIx Standard are defined in terms of the C-programming language. Implementers wishing to support other languages should provide the equivalent definitions in a language-appropriate manner.

If a PMIx implementation chooses to define additional attributes they should avoid using the `PMIX` prefix in their name or starting the attribute string with a `pmix` prefix. This helps the end user distinguish between what is defined by the PMIx standard and what is specific to that PMIx implementation, and avoids potential conflicts with attributes defined by the standard.

---

### 3.1 Constants

PMIx defines a few values that are used throughout the standard to set the size of fixed arrays or as a means of identifying values with special meaning. The community makes every attempt to minimize the number of such definitions. The constants defined in this section may be used before calling any PMIx library initialization routine. Additional constants associated with specific data structures or types are defined in the section describing that data structure or type.

- `PMIX_MAX_NSLEN` Maximum namespace string length as an integer.

--- Advice to PMIx library implementers ---

`PMIX_MAX_NSLEN` should have a minimum value of 63 characters. Namespace arrays in PMIx defined structures must reserve a space of size `PMIX_MAX_NSLEN +1` to allow room for the `NULL` terminator.

- `PMIX_MAX_KEYLEN` Maximum key string length as an integer.
Advice to PMIx library implementers

PMIX_MAX_KEYLEN should have a minimum value of 63 characters. Key arrays in PMIx defined structures must reserve a space of size PMIX_MAX_KEYLEN +1 to allow room for the NULL terminator.

3.1.1 Error Constants

The pmix_status_t structure is an int type for return status.

The tables shown in this section define the possible values for pmix_status_t. PMIx errors are required to always be negative, with 0 reserved for PMIX_SUCCESS.

A PMIx implementation must define all of the constants defined in this section, even if they will never return the specific value to the caller.

Advice to users

Other than PMIX_SUCCESS (which is required to be zero), the actual value of any PMIx error constant is left to the PMIx library implementer. Thus, users are advised to always refer to constant by name, and not a specific implementation's value, for portability between implementations and compatibility across library versions.
3.1.1 PMIx v1 Error Constants

The following list contains those constants defined in the PMIx v1 standard. Those values in the list that were deprecated in later standards are denoted as such. PMIx errors are always negative, with 0 reserved for success.

- PMIX_SUCCESS: Success
- PMIX_ERROR: General Error
- PMIX_ERR_SILENT: Silent error
- PMIX_ERR_DEBUGGER_RELEASE: Error in debugger release
- PMIX_ERR_PROC_RESTART: Fault tolerance: Error in process restart
- PMIX_ERR_PROC_CHECKPOINT: Fault tolerance: Error in process checkpoint
- PMIX_ERR_PROC_MIGRATE: Fault tolerance: Error in process migration
- PMIX_ERR_PROC_ABORTED: Process was aborted
- PMIX_ERR_PROC_REQUESTED_ABORT: Process is already requested to abort
- PMIX_ERR_PROC_ABORTING: Process is being aborted
- PMIX_ERR_SERVER_FAILED_REQUEST: Failed to connect to the server
- PMIX_EXISTS: Requested operation would overwrite an existing value
- PMIX_ERR_INVALID_CRED: Invalid security credentials
- PMIX_ERR_HANDSHAKE_FAILED: Connection handshake failed
- PMIX_ERR_READY_FOR_HANDSHAKE: Ready for handshake
- PMIX_ERR_WOULD_BLOCK: Operation would block
- PMIX_ERR_UNKNOWN_DATA_TYPE: Unknown data type
- PMIX_ERR_PROC_ENTRY_NOT_FOUND: Process not found
- PMIX_ERR_TYPE_MISMATCH: Invalid type
- PMIX_ERR_UNPACK_INADEQUATE_SPACE: Inadequate space to unpack data
- PMIX_ERR_UNPACK_FAILURE: Unpack failed
- PMIX_ERR_PACK_FAILURE: Pack failed
- PMIX_ERR_PACK_MISMATCH: Pack mismatch
- PMIX_ERR_NO_PERMISSIONS: No permissions
- PMIX_ERR_TIMEOUT: Timeout expired
- PMIX_ERR_UNREACH: Unreachable
- PMIX_ERR_IN_ERRNO: Error defined in errno
- PMIX_ERR_BAD_PARAM: Bad parameter
- PMIX_ERR_Resource_BUSY: Resource busy
- PMIX_ERR_OUT_OF_RESOURCE: Resource exhausted
- PMIX_ERR_DATA_VALUE_NOT_FOUND: Data value not found
- PMIX_ERR_INIT: Error during initialization
- PMIX_ERR_NOMEM: Out of memory
- PMIX_ERR_INVALID_ARG: Invalid argument
- PMIX_ERR_INVALID_KEY: Invalid key
- PMIX_ERR_INVALID_KEY_LENGTH: Invalid key length
- PMIX_ERR_INVALID_VAL: Invalid value
PMIX_ERR_INVALID_VAL_LENGTH Invalid value length
PMIX_ERR_INVALID_LENGTH Invalid argument length
PMIX_ERR_INVALID_NUM_ARGS Invalid number of arguments
PMIX_ERR_INVALID_ARGS Invalid arguments
PMIX_ERR_INVALID_NUM_PARSED Invalid number parsed
PMIX_ERR_INVALID_KEYVALP Invalid key/value pair
PMIX_ERR_INVALID_SIZE Invalid size
PMIX_ERR_INVALID_NAMESPACE Invalid namespace
PMIX_ERR_SERVER_NOT_AVAIL Server is not available
PMIX_ERR_NOT_FOUND Not found
PMIX_ERR_NOT_SUPPORTED Not supported
PMIX_ERR_NOT_IMPLEMENTED Not implemented
PMIX_ERR_COMM_FAILURE Communication failure
PMIX_ERR_UNPACK_READ_PAST_END_OF_BUFFER Unpacking past the end of the buffer

3.1.1.2 PMIx v2 Error Constants

The following list contains constants added in the PMIx v2 standard.

PMIX_ERR_LOST_CONNECTION_TO_SERVER Lost connection to server
PMIX_ERR_LOST_PEER_CONNECTION Lost connection to peer
PMIX_ERR_LOST_CONNECTION_TO_CLIENT Lost connection to client
PMIX_QUERY_PARTIAL_SUCCESS Query partial success (used by query system)
PMIX_NOTIFY_ALLOC_COMPLETE Notify that allocation is complete
PMIX_JCTRL_CHECKPOINT Job control: Monitored by PMIx client to trigger checkpoint operation
PMIX_JCTRL_CHECKPOINT_COMPLETE Job control: Sent by PMIx client and monitored by PMIx server to notify that requested checkpoint operation has completed.
PMIX_JCTRL_PREEMPT_ALERT Job control: Monitored by PMIx client to detect an RM intending to preempt the job.
PMIX_MONITOR_HEARTBEAT_ALERT Job monitoring: Heartbeat alert
PMIX_MONITOR_FILE_ALERT Job monitoring: File alert
PMIX_PROC_TERMINATED Process terminated - can be either normal or abnormal termination
PMIX_ERR_INVALID_TERMINATION Process terminated without calling PMIx_Finalize, or was a member of an assemblage formed via PMIx_Connect and terminated or called PMIx_Finalize without first calling PMIx_Disconnect (or its non-blocking form) from that assemblage.

The following list contains operational error constants introduced in the v2 standard.

PMIX_ERR_EVENT_REGISTRATION Error in event registration
PMIX_ERR_JOB_TERMINATED Error job terminated
PMIX_ERR_UPDATE_ENDPOINTS Error updating endpoints
PMIX_MODEL_DECLARED  Model declared
PMIX_GDS_ACTION_COMPLETE  The global data storage (GDS) action has completed
PMIX_ERR_INVALID_OPERATION  The requested operation is supported by the
                              implementation and host environment, but fails to meet a requirement (e.g., requesting to
disconnect from processes without first connecting to them).

The following list contains system error constants introduced in the v2 standard.

PMIX_ERR_NODE_DOWN  Node down
PMIX_ERR_NODE_OFFLINE  Node is marked as offline

The following list contains event handler error constants introduced in the v2 standard.

PMIX_EVENT_NO_ACTION_TAKEN  Event handler: No action taken
PMIX_EVENT_PARTIAL_ACTION_TAKEN  Event handler: Partial action taken
PMIX_EVENT_ACTION_DEFERRED  Event handler: Action deferred
PMIX_EVENT_ACTION_COMPLETE  Event handler: Action complete

3.1.3 User-Defined Error Constants

PMIx establishes an error code boundary for constants defined in the PMIx standard. Negative
values larger than this (and any positive values greater than zero) are guaranteed not to conflict with
PMIx values.

PMIX_EXTERNAL_ERR_BASE  A starting point for user-level defined error constants.
Negative values lower than this are guaranteed not to conflict with PMIx values. Definitions
should always be based on the PMIX_EXTERNAL_ERR_BASE constant and not a specific
value as the value of the constant may change.

3.2 Data Types

This section defines various data types used by the PMIx APIs.

3.2.1 Key Structure

The pmix_key_t structure is a statically defined character array of length PMIX_MAX_KEYLEN
+1, thus supporting keys of maximum length PMIX_MAX_KEYLEN while preserving space for a
mandatory NULL terminator.

PMIx v2.0

typedef char pmix_key_t[PMIX_MAX_KEYLEN+1];
Characters in the key must be standard alphanumeric values supported by common utilities such as `strcmp`.

**Advice to users**

References to keys in PMIx v1 were defined simply as an array of characters of size `PMIX_MAX_KEYLEN+1`. The `pmix_key_t` type definition was introduced in version 2 of the standard. The two definitions are code-compatible and thus do not represent a break in backward compatibility.

Passing a `pmix_key_t` value to the standard `sizeof` utility can result in compiler warnings of incorrect returned value. Users are advised to avoid using `sizeof(pmix_key_t)` and instead rely on the `PMIX_MAX_KEYLEN` constant.

### 3.2.2 Namespace Structure

The `pmix_nspace_t` structure is a statically defined character array of length `PMIX_MAX_NSLEN +1`, thus supporting namespaces of maximum length `PMIX_MAX_NSLEN` while preserving space for a mandatory NULL terminator.

```
Pmix v2.0
```

```c
typedef char pmix_nspace_t[PMIX_MAX_NSLEN+1];
```

Characters in the namespace must be standard alphanumeric values supported by common utilities such as `strcmp`.

**Advice to users**

References to namespace values in PMIx v1 were defined simply as an array of characters of size `PMIX_MAX_NSLEN+1`. The `pmix_nspace_t` type definition was introduced in version 2 of the standard. The two definitions are code-compatible and thus do not represent a break in backward compatibility.

Passing a `pmix_nspace_t` value to the standard `sizeof` utility can result in compiler warnings of incorrect returned value. Users are advised to avoid using `sizeof(pmix_nspace_t)` and instead rely on the `PMIX_MAX_NSLEN` constant.
3.2.3 Rank Structure

The `pmix_rank_t` structure is a `uint32_t` type for rank values.

```
typedef uint32_t pmix_rank_t;
```

The following constants can be used to set a variable of the type `pmix_rank_t`. All definitions were introduced in version 1 of the standard unless otherwise marked. Valid rank values start at zero.

- `PMIX_RANK_UNDEF`: A value to request job-level data where the information itself is not associated with any specific rank, or when passing a `pmix_proc_t` identifier to an operation that only references the namespace field of that structure.
- `PMIX_RANK_WILDCARD`: A value to indicate that the user wants the data for the given key from every rank that posted that key.
- `PMIX_RANK_LOCAL_NODE`: Special rank value used to define groups of ranks for use in collectives. This constant defines the group of all ranks on a local node.

3.2.4 Process Structure

The `pmix_proc_t` structure is used to identify a single process in the PMIx universe. It contains a reference to the namespace and the `pmix_rank_t` within that namespace.

```
typedef struct pmix_proc {
    pmix_nspace_t nspace;
    pmix_rank_t rank;
} pmix_proc_t;
```

3.2.5 Process structure support macros

The following macros are provided to support the `pmix_proc_t` structure.
3.2.5.1 Initialize the `pmix_proc_t` structure

Initialize the `pmix_proc_t` fields

```c
PMIx v1.0
PMIX_PROC_CONSTRUCT(m)
```

**IN** `m`  
Pointer to the structure to be initialized (pointer to `pmix_proc_t`)

3.2.5.2 Destruct the `pmix_proc_t` structure

Clear the `pmix_proc_t` fields

```c
PMIx v1.0
PMIX_PROC_DESTRUCT(m)
```

**IN** `m`  
Pointer to the structure to be destructed (pointer to `pmix_proc_t`)

This macro performs the identical operations as `PMIX_PROC_CONSTRUCT`, but is provided for symmetry in user code.

3.2.5.3 Create a `pmix_proc_t` array

Allocate and initialize an array of `pmix_proc_t` structures

```c
PMIx v1.0
PMIX_PROC_CREATE(m, n)
```

**INOUT** `m`  
Address where the pointer to the array of `pmix_proc_t` structures shall be stored (handle)

**IN** `n`  
Number of structures to be allocated (`size_t`)
3.2.5.4 Free a `pmix_proc_t` array

Release an array of `pmix_proc_t` structures

```c
PMIx v1.0
PMIX_PROC_FREE(m, n)
```

- **IN m**  
  Pointer to the array of `pmix_proc_t` structures (handle)
- **IN n**  
  Number of structures in the array (`size_t`)

3.2.5.5 Load a `pmix_proc_t` structure

Load values into a `pmix_proc_t`

```c
PMIx v2.0
PMIX_PROC_LOAD(m, n, r)
```

- **IN m**  
  Pointer to the structure to be loaded (pointer to `pmix_proc_t`)
- **IN n**  
  Namespace to be loaded (`pmix_nspace_t`)
- **IN r**  
  Rank to be assigned (`pmix_rank_t`)

3.2.6 Process State Structure

The `pmix_proc_state_t` structure is a `uint8_t` type for process state values. The following constants can be used to set a variable of the type `pmix_proc_state_t`. All values were originally defined in version 2 of the standard unless otherwise marked.

Advice to users

The fine-grained nature of the following constants may exceed the ability of an RM to provide updated process state values during the process lifetime. This is particularly true of states in the launch process, and for short-lived processes.
PMIX_PROC_STATE_UNDEF      Undefined process state
PMIX_PROC_STATE_PREPPED     Process is ready to be launched
PMIX_PROC_STATE_LAUNCH_UNDERWAY Process launch is underway
PMIX_PROC_STATE_RESTART     Process is ready for restart
PMIX_PROC_STATE_TERMINATE   Process is marked for termination
PMIX_PROC_STATE_RUNNING     Process has been locally fork'ed by the RM
PMIX_PROC_STATE_CONNECTED   Process has connected to PMIx server
PMIX_PROC_STATE_UNTERMINATED Define a “boundary” between this constant and
                                PMIX_PROC_STATE_CONNECTED so users can easily and quickly
define if a process is still running or not. Any value less than this constant
means that the process has not terminated.
PMIX_PROC_STATE_TERMINATED  Process has terminated and is no longer running
PMIX_PROC_STATE_ERROR       Define a boundary so users can easily and quickly determine if
                            a process abnormally terminated. Any value above this constant
means that the process has terminated abnormally.
PMIX_PROC_STATE_KILLED_BY_CMD Process was killed by a command
PMIX_PROC_STATE_ABORTED     Process was aborted by a call to PMIx Abort
PMIX_PROC_STATE_FAILED_TO_START Process failed to start
PMIX_PROC_STATE_ABORTED_BY_SIG Process aborted by a signal
PMIX_PROC_STATE_TERM_WO_SYNC Process exited without calling PMIx_Finalize
PMIX_PROC_STATE_COMM_FAILED Process communication has failed
PMIX_PROC_STATE_CALLED_ABORT Process called PMIx Abort
PMIX_PROC_STATE_MIGRATING   Process failed and is waiting for resources before
                            restarting
PMIX_PROC_STATE_CANNOT_RESTART Process failed and cannot be restarted
PMIX_PROC_STATE_TERM_NON_ZERO Process exited with a non-zero status
PMIX_PROC_STATE_FAILED_TO_LAUNCH Unable to launch process

3.2.7 Process Information Structure

The pmix_proc_info_t structure defines a set of information about a specific process
including it’s name, location, and state.

PMIx v2.0
typedef struct pmix_proc_info {
    /**< Process structure */
    pmix_proc_t proc;
    /**< Hostname where process resides */
    char *hostname;
    /**< Name of the executable */
    char *executable_name;
    /**< Process ID on the host */
    pid_t pid;
    /**< Exit code of the process. Default: 0 */
    int exit_code;
    /**< Current state of the process */
    pmix_proc_state_t state;
} pmix_proc_info_t;

3.2.8 Process Information Structure support macros

The following macros are provided to support the pmix_proc_info_t structure.

3.2.8.1 Initialize the pmix_proc_info_t structure

Initialize the pmix_proc_info_t fields

PMIx v2.0

PMIX_PROC_INFO_CONSTRUCT(m)

IN m
Pointer to the structure to be initialized (pointer to pmix_proc_info_t)

3.2.8.2 Destroy the pmix_proc_info_t structure

Destruct the pmix_proc_info_t fields

PMIx v2.0

PMIX_PROC_INFO_DESTRUCT(m)

IN m
Pointer to the structure to be destructed (pointer to pmix_proc_info_t)
3.2.8.3 **Create a `pmix_proc_info_t` array**

Allocate and initialize a `pmix_proc_info_t` array

```c
PMIx v2.0
PMIX_PROC_INFO_CREATE(m, n)
```

- **INOUT** `m`
  - Address where the pointer to the array of `pmix_proc_info_t` structures shall be stored (handle)
- **IN** `n`
  - Number of structures to be allocated (`size_t`)

3.2.8.4 **Free a `pmix_proc_info_t` array**

Release an array of `pmix_proc_info_t` structures

```c
PMIx v2.0
PMIX_PROC_INFO_FREE(m, n)
```

- **IN** `m`
  - Pointer to the array of `pmix_proc_info_t` structures (handle)
- **IN** `n`
  - Number of structures in the array (`size_t`)

3.2.9 **Scope of Put Data**

The `pmix_scope_t` structure is a `uint8_t` type that defines the scope for data passed to `PMIx_Put`. The following constants can be used to set a variable of the type `pmix_scope_t`.

All definitions were introduced in version 1 of the standard unless otherwise marked.

Specific implementations may support different scope values, but all implementations must support at least `PMIX_GLOBAL`. If a scope value is not supported, then the `PMIx_Put` call must return `PMIX_ERR_NOT_SUPPORTED`.

- `PMIX_SCOPE_UNDEF` Undefined scope
- `PMIX_LOCAL` The data is intended only for other application processes on the same node. Data marked in this way will not be included in data packages sent to remote requestors — i.e., it is only available to processes on the local node.
- `PMIX_REMOTE` The data is intended solely for applications processes on remote nodes. Data marked in this way will not be shared with other processes on the same node — i.e., it is only available to processes on remote nodes.
The data is to be shared with all other requesting processes, regardless of location.

The data is intended solely for this process and is not shared with other processes.

### 3.2.10 Range of Published Data

The `pmix_data_range_t` structure is a `uint8_t` type that defines a range for data published via functions other than `PMIx_Put` - e.g., the `PMIx_Publish` API. The following constants can be used to set a variable of the type `pmix_data_range_t`. Several values were initially defined in version 1 of the standard but subsequently renamed and other values added in version 2. Thus, all values shown below are as they were defined in version 2 except where noted.

- `PMIX_RANGE_UNDEF`: Undefined range
- `PMIX_RANGE_RM`: Data is intended for the host resource manager.
- `PMIX_RANGE_LOCAL`: Data is only available to processes on the local node.
- `PMIX_RANGE_NAMESPACE`: Data is only available to processes in the same namespace.
- `PMIX_RANGE_SESSION`: Data is only available to all processes in the session.
- `PMIX_RANGE_GLOBAL`: Data is available to all processes.
- `PMIX_RANGE_CUSTOM`: Range is specified in the `pmix_info_t` associated with this call.
- `PMIX_RANGE_PROC_LOCAL`: Data is only available to this process.

Advice to users

The names of the `pmix_data_range_t` values changed between version 1 and version 2 of the standard, thereby breaking backward compatibility.

### 3.2.11 Data Persistence Structure

The `pmix_persistence_t` structure is a `uint8_t` type that defines the policy for data published by clients via the `PMIx_Publish` API. The following constants can be used to set a variable of the type `pmix_persistence_t`. All definitions were introduced in version 1 of the standard unless otherwise marked.

- `PMIX_PERSIST_INDEF`: Retain data until specifically deleted.
- `PMIX_PERSIST_FIRST_READ`: Retain data until the first access, then the data is deleted.
- `PMIX_PERSIST_PROC`: Retain data until the publishing process terminates.
- `PMIX_PERSIST_APP`: Retain data until the application terminates.
- `PMIX_PERSIST_SESSION`: Retain data until the session/allocation terminates.
3.2.12 Value Structure

The `pmix_value_t` structure is used to represent the value passed to `PMIx_Put` and retrieved by `PMIx_Get`, as well as many of the other PMIx functions.

A collection of values may be specified under a single key by passing a `pmix_value_t` containing an array of type `pmix_data_array_t`, with each array element containing its own object. All members shown below were introduced in version 1 of the standard unless otherwise marked.

```c
typedef struct pmix_value {
    pmix_data_type_t type;
    union {
        bool flag;
        uint8_t byte;
        char *string;
        size_t size;
        pid_t pid;
        int integer;
        int8_t int8;
        int16_t int16;
        int32_t int32;
        int64_t int64;
        unsigned int uint;
        uint8_t uint8;
        uint16_t uint16;
        uint32_t uint32;
        uint64_t uint64;
        float fval;
        double dval;
        struct timeval tv;
        time_t time; // version 2.0
        pmix_status_t status; // version 2.0
        pmix_rank_t rank; // version 2.0
        pmix_proc_t *proc; // version 2.0
        pmix_byte_object_t bo;
        pmix_persistence_t persist; // version 2.0
        pmix_scope_t scope; // version 2.0
        pmix_data_range_t range; // version 2.0
        pmix_proc_state_t state; // version 2.0
        pmix_proc_info_t *pinfo; // version 2.0
        pmix_data_array_t *darray; // version 2.0
        void *ptr; // version 2.0
    }
} pmix_value_t;
```
pmix_alloc_directive_t adir;    // version 2.0
/** DEPRECATED in PMIx 2 ****/
pmix_info_array_t *array;
/******************************/
}
data;
} pmix_value_t;

3.2.13 Value structure support macros

The following macros are provided to support the pmix_value_t structure.

3.2.13.1 Initialize the pmix_value_t structure

Initialize the pmix_value_t fields

\[ PMIx v1.0 \]
\[ \text{PMIX}_\text{VALUE}\_\text{CONSTRUCT}(m) \]
\[ \text{IN } m \]
Point to the structure to be initialized (pointer to pmix_value_t)

3.2.13.2 Destruct the pmix_value_t structure

Destruct the pmix_value_t fields

\[ PMIx v1.0 \]
\[ \text{PMIX}_\text{VALUE}\_\text{DESTRUCT}(m) \]
\[ \text{IN } m \]
Point to the structure to be destructed (pointer to pmix_value_t)

3.2.13.3 Create a pmix_value_t array

Allocate and initialize an array of pmix_value_t structures

\[ PMIx v1.0 \]
\[ \text{PMIX}_\text{VALUE}\_\text{CREATE}(m, n) \]
\[ \text{INOUT } m \]
Address where the pointer to the array of pmix_value_t structures shall be stored (handle)
\[ \text{IN } n \]
Number of structures to be allocated (size_t)
### 3.2.13.4 Free a `pmix_value_t` array

Release an array of `pmix_value_t` structures

**PMIx v1.0**

```c
PMIX_VALUE_FREE(m, n)
```

**IN** m

Pointer to the array of `pmix_value_t` structures (handle)

**IN** n

Number of structures in the array (`size_t`)

### 3.2.14 Load a `pmix_value_t` structure

**Summary**

Load data into a `pmix_value_t` structure.

**PMIx v2.0**

```c
PMIX_VALUE_LOAD(v, d, t);
```

**IN** v

The `pmix_value_t` into which the data is to be loaded (pointer to `pmix_value_t`)

**IN** d

Pointer to the data value to be loaded (handle)

**IN** t

Type of the provided data value (`pmix_data_type_t`)

**Description**

This macro simplifies the loading of data into a `pmix_value_t` by correctly assigning values to the structure’s fields.

**Advice to users**

The data will be copied into the `pmix_value_t` - thus, any data stored in the source value can be modified or free’d without affecting the copied data once the macro has completed.
3.2.14.1 Transfer data between \texttt{pmix_value_t} structures

Summary

Transfer the data value between two \texttt{pmix_value_t} structures.

\texttt{PMIx v2.0}

\begin{verbatim}
PMIX_VALUE_XFER(r, d, s);
\end{verbatim}

\textbf{OUT} \hspace{1em} r

Status code indicating success or failure of the transfer (\texttt{pmix_status_t})

\textbf{IN} \hspace{1em} d

Pointer to the \texttt{pmix_value_t} destination (handle)

\textbf{IN} \hspace{1em} s

Pointer to the \texttt{pmix_value_t} source (handle)

Description

This macro simplifies the transfer of data between two \texttt{pmix_value_t} structures, ensuring that all fields are properly copied.

\textbf{Advice to users}

The data will be copied into the destination \texttt{pmix_value_t} - thus, any data stored in the source value can be modified or free’d without affecting the copied data once the macro has completed.

3.2.15 Info and Info Array Structures

The \texttt{pmix_info_t} structure defines a key/value pair with associated directive. All fields were defined in version 1.0 unless otherwise marked.

\texttt{PMIx v1.0}

\begin{verbatim}
typedef struct pmix_info_t {
    pmix_key_t key;
    pmix_info_directives_t flags; // version 2.0
    pmix_value_t value;
} pmix_info_t;
\end{verbatim}

The \texttt{pmix_info_array} structure defines an array of \texttt{pmix_info_t} structures.
Note: The `pmix_info_array` structure has been deprecated and will be removed in future versions of the PMIx Standard.

```c
typedef struct pmix_info_array {
    size_t size;
    pmix_info_t *array;
} pmix_info_array_t;
```

### 3.2.16 Info structure support macros

The following macros are provided to support the `pmix_info_t` structure.

#### 3.2.16.1 Initialize the `pmix_info_t` structure

Initialize the `pmix_info_t` fields

```c
PMIx v1.0

PMIX_INFO_CONSTRUCT(m)
```

**IN** `m`

Pointer to the structure to be initialized (pointer to `pmix_info_t`)

#### 3.2.16.2 Destruct the `pmix_info_t` structure

Destruct the `pmix_info_t` fields

```c
PMIx v1.0

PMIX_INFO_DESTRUCT(m)
```

**IN** `m`

Pointer to the structure to be destructed (pointer to `pmix_info_t`)

### 3.2.16.3 Create a pmix_info_t array

Allocate and initialize an array of pmix_info_t structures

```
PMIx v1.0
PMIX_INFO_CREATE(m, n)
```

- **INOUT m**: Address where the pointer to the array of pmix_info_t structures shall be stored (handle)
- **IN n**: Number of structures to be allocated (size_t)

### 3.2.16.4 Free a pmix_info_t array

Release an array of pmix_info_t structures

```
PMIX v1.0
PMIX_INFO_FREE(m, n)
```

- **IN m**: Pointer to the array of pmix_info_t structures (handle)
- **IN n**: Number of structures in the array (size_t)

### 3.2.16.5 Load key and value data into a pmix_info_t

```
PMIX v1.0
PMIX_INFO_LOAD(v, k, d, t);
```

- **IN v**: Pointer to the pmix_info_t into which the key and data are to be loaded (pointer to pmix_info_t)
- **IN k**: String key to be loaded - must be less than or equal to PMIX_MAX_KEYLEN in length (handle)
- **IN d**: Pointer to the data value to be loaded (handle)
- **IN t**: Type of the provided data value (pmix_data_type_t)

This macro simplifies the loading of key and data into a pmix_info_t by correctly assigning values to the structure’s fields.
Advice to users

Both key and data will be copied into the \texttt{pmix_info_t} - thus, the key and any data stored in the source value can be modified or free’d without affecting the copied data once the macro has completed.

3.2.16.6 Copy data between \texttt{pmix_info_t} structures

Copy all data (including key, value, and directives) between two \texttt{pmix_info_t} structures.

\texttt{PMIx v2.0}\n\begin{verbatim}
PMIX_INFO_XFER(d, s);
\end{verbatim}\n
\texttt{IN} \texttt{d} \hspace{1cm} \texttt{IN} \texttt{s}

Pointer to the destination \texttt{pmix_info_t} (pointer to \texttt{pmix_info_t})

Pointer to the source \texttt{pmix_info_t} (pointer to \texttt{pmix_info_t})

This macro simplifies the transfer of data between two \texttt{pmix_info_t} structures.

Advice to users

All data (including key, value, and directives) will be copied into the destination \texttt{pmix_info_t} - thus, the source \texttt{pmix_info_t} may be free’d without affecting the copied data once the macro has completed.

3.2.16.7 Test a boolean \texttt{pmix_info_t}

A special macro for checking if a boolean \texttt{pmix_info_t} is \texttt{true}

\texttt{PMIx v2.0}\n\begin{verbatim}
PMIX_INFO_TRUE(m)
\end{verbatim}\n
\texttt{IN} \texttt{m}

Pointer to a \texttt{pmix_info_t} structure (handle)

A \texttt{pmix_info_t} structure is considered to be of type \texttt{PMIX_BOOL} and value \texttt{true} if:

- the structure reports a type of \texttt{PMIX_UNDEF}, or
- the structure reports a type of \texttt{PMIX_BOOL} and the data flag is \texttt{true}
3.2.17 Info Type Directives

The `pmix_info_directives_t` structure is a `uint32_t` type that defines the behavior of command directives via `pmix_info_t` arrays. By default, the values in the `pmix_info_t` array passed to a PMIx are optional.

**Advice to users**

A PMIx implementation or PMIx-enabled RM may ignore any `pmix_info_t` value passed to a PMIx API if it is not explicitly marked as `PMIX_INFO_REQD`. This is because the values specified default to optional, meaning they can be ignored. This may lead to unexpected behavior if the user is relying on the behavior specified by the `pmix_info_t` value. If the user relies on the behavior defined by the `pmix_info_t` then they must set the `PMIX_INFO_REQD` flag using the `PMIX_INFO_REQUIRED` macro.

**Advice to PMIx library implementers**

The top 16-bits of the `pmix_info_directives_t` are reserved for internal use by PMIx library implementers - the PMIx standard will not specify their intent, leaving them for customized use by implementers. Implementers are advised to use the provided `PMIX_INFO_IS_REQUIRED` macro for testing this flag, and must return `PMIX_ERR_NOT_SUPPORTED` as soon as possible to the caller if the required behavior is not supported.

The following constants were introduced in version 2.0 (unless otherwise marked) and can be used to set a variable of the type `pmix_info_directives_t`.

`PMIX_INFO_REQD` The behavior defined in the `pmix_info_t` array is required, and not optional. This is a bit-mask value.

**Advice to PMIx server hosts**

Host environments are advised to use the provided `PMIX_INFO_IS_REQUIRED` macro for testing this flag and must return `PMIX_ERR_NOT_SUPPORTED` as soon as possible to the caller if the required behavior is not supported.

3.2.18 Info Directive support macros

The following macros are provided to support the setting and testing of `pmix_info_t` directives.
3.2.18.1 Mark an info structure as required

Summary

Set the PMIX_INFO_REQD flag in a pmix_info_t structure.

PMIx v2.0
PMIX_INFO_REQUIRED(info);

IN info
Pointer to the pmix_info_t (pointer to pmix_info_t)

This macro simplifies the setting of the PMIX_INFO_REQD flag in pmix_info_t structures.

3.2.18.2 Test an info structure for required directive

Summary

Test the PMIX_INFO_REQD flag in a pmix_info_t structure, returning true if the flag is set.

PMIx v2.0
PMIX_INFO_IS_REQUIRED(info);

IN info
Pointer to the pmix_info_t (pointer to pmix_info_t)

This macro simplifies the testing of the required flag in pmix_info_t structures.

3.2.19 Job Allocation Directives

PMIx v2.0

The pmix_alloc_directive_t structure is a uint8_t type that defines the behavior of allocation requests. The following constants can be used to set a variable of the type pmix_alloc_directive_t. All definitions were introduced in version 2 of the standard unless otherwise marked.

PMIX_ALLOC_NEW   A new allocation is being requested. The resulting allocation will be disjoint (i.e., not connected in a job sense) from the requesting allocation.

PMIX_ALLOC_EXTEND   Extend the existing allocation, either in time or as additional resources.

PMIX_ALLOC_RELEASE   Release part of the existing allocation. Attributes in the accompanying pmix_info_t array may be used to specify permanent release of the identified resources, or “lending” of those resources for some period of time.

PMIX_ALLOC_REAQUIRE   Reacquire resources that were previously “lent” back to the scheduler.

PMIX_ALLOC_EXTERNAL   A value boundary above which implementers are free to define their own directive values.
3.2.20 Lookup Returned Data Structure

The `pmix_pdata_t` structure is used by `PMIx.Lookup` to describe the data being accessed.

```c
typedef struct pmix_pdata {
    pmix_proc_t proc;
    pmix_key_t key;
    pmix_value_t value;
} pmix_pdata_t;
```

3.2.21 Lookup data structure support macros

The following macros are provided to support the `pmix_pdata_t` structure.

3.2.21.1 Initialize the `pmix_pdata_t` structure

Initialize the `pmix_pdata_t` fields

```c
PMIX_PDATA_CONSTRUCT(m)
```

IN `m`

Pointer to the structure to be initialized (pointer to `pmix_pdata_t`)

3.2.21.2 Destruct the `pmix_pdata_t` structure

Destruct the `pmix_pdata_t` fields

```c
PMIX_PDATA_DESTRUCT(m)
```

IN `m`

Pointer to the structure to be destructed (pointer to `pmix_pdata_t`)

CHAPTER 3. DATA STRUCTURES AND TYPES 37
### 3.2.21.3 Create a `pmix_pdata_t` array

Allocate and initialize an array of `pmix_pdata_t` structures

```c
PMIx v1.0

PMIX_PDATA_CREATE(m, n)
```

- **INOUT m**
  Address where the pointer to the array of `pmix_pdata_t` structures shall be stored (handle)
- **IN n**
  Number of structures to be allocated (`size_t`)

### 3.2.21.4 Free a `pmix_pdata_t` array

Release an array of `pmix_pdata_t` structures

```c
PMIx v1.0

PMIX_PDATA_FREE(m, n)
```

- **IN m**
  Pointer to the array of `pmix_pdata_t` structures (handle)
- **IN n**
  Number of structures in the array (`size_t`)

### 3.2.21.5 Load a lookup data structure

**Summary**

Load key, process identifier, and data value into a `pmix_pdata_t` structure.

```c
PMIx v1.0

PMIX_PDATA_LOAD(m, p, k, d, t);
```

- **IN m**
  Pointer to the `pmix_pdata_t` structure into which the key and data are to be loaded (pointer to `pmix_pdata_t`)
- **IN p**
  Pointer to the `pmix_proc_t` structure containing the identifier of the process being referenced (pointer to `pmix_proc_t`)
- **IN k**
  String key to be loaded - must be less than or equal to `PMIX_MAX_KEYLEN` in length (handle)
IN \( d \)

Pointer to the data value to be loaded (handle)

IN \( t \)

Type of the provided data value (\texttt{pmix\_data\_type\_t})

This macro simplifies the loading of key, process identifier, and data into a \texttt{pmix\_proc\_t} by correctly assigning values to the structure’s fields.

\begin{verbatim}
\textbf{Advice to users}
\end{verbatim}

Key, process identifier, and data will all be copied into the \texttt{pmix\_pdata\_t} - thus, the source information can be modified or free’d without affecting the copied data once the macro has completed.

\section{3.2.21.6 Transfer a lookup data structure}

\textbf{Summary}

Transfer key, process identifier, and data value between two \texttt{pmix\_pdata\_t} structures.

\begin{verbatim}
PMIx v2.0
\end{verbatim}

\begin{verbatim}
PMIX_PDATA_XFER(d, s);
\end{verbatim}

\begin{verbatim}
\textbf{Advice to users}
\end{verbatim}

Key, process identifier, and data will all be copied into the destination \texttt{pmix\_pdata\_t} - thus, the source \texttt{pmix\_pdata\_t} may free’d without affecting the copied data once the macro has completed.
3.2.22 Application Structure

The `pmix_app_t` structure describes the application context for the `PMIx_Spawn` and `PMIx_Spawn_nb` operations.

```c
typedef struct pmix_app {
  /** Executable */
  char *cmd;
  /** Argument set, NULL terminated */
  char **argv;
  /** Environment set, NULL terminated */
  char **env;
  /** Current working directory */
  char *cwd;
  /** Maximum processes with this profile */
  int maxprocs;
  /** Array of info keys describing this application*/
  pmix_info_t *info;
  /** Number of info keys in 'info' array */
  size_t ninfo;
} pmix_app_t;
```

3.2.23 App structure support macros

The following macros are provided to support the `pmix_app_t` structure.

3.2.23.1 Initialize the `pmix_app_t` structure

Initialize the `pmix_app_t` fields

```c
PMIX_APP_CONSTRUCT(m)

IN m
    Pointer to the structure to be initialized (pointer to `pmix_app_t`)
```
3.2.23.2 Destruct the pmix_app_t structure

Destruct the pmix_app_t fields

PMIx v1.0
PMIX_APP_DESTRUCT (m)

IN m
Pointer to the structure to be destructed (pointer to pmix_app_t)

3.2.23.3 Create a pmix_app_t array

Allocate and initialize an array of pmix_app_t structures

PMIx v1.0
PMIX_APP_CREATE (m, n)

INOUT m
Address where the pointer to the array of pmix_app_t structures shall be stored (handle)

IN n
Number of structures to be allocated (size_t)

3.2.23.4 Free a pmix_app_t array

Release an array of pmix_app_t structures

PMIx v1.0
PMIX_APP_FREE (m, n)

IN m
Pointer to the array of pmix_app_t structures (handle)

IN n
Number of structures in the array (size_t)
3.2.24 Query Structure

The pmix_query_t structure is used by PMIx_Query_info_nb to describe a single query operation.

```c
PMIx v2.0
typedef struct pmix_query {
    char **keys;
    pmix_info_t *qualifiers;
    size_t nqual;
} pmix_query_t;
```

3.2.25 Query structure support macros

The following macros are provided to support the pmix_query_t structure.

3.2.25.1 Initialize the pmix_query_t structure

Initialize the pmix_query_t fields

```c
PMIx v2.0
PMIX_QUERY_CONSTRUCT(m)
```

IN m

Pointer to the structure to be initialized (pointer to pmix_query_t)

3.2.25.2 Destruct the pmix_query_t structure

Destruct the pmix_query_t fields

```c
PMIx v2.0
PMIX_QUERY_DESTRUCT(m)
```

IN m

Pointer to the structure to be destructed (pointer to pmix_query_t)
3.2.25.3 **Create a pmix_query_t array**

Allocate and initialize an array of pmix_query_t structures

```
PMIx v2.0
``` PMIX_QUERY_CREATE(m, n)

**INOUT m**
Address where the pointer to the array of pmix_query_t structures shall be stored (handle)

**IN n**
Number of structures to be allocated (size_t)

3.2.25.4 **Free a pmix_query_t array**

Release an array of pmix_query_t structures

```
PMIx v2.0
``` PMIX_QUERY_FREE(m, n)

**IN m**
Pointer to the array of pmix_query_t structures (handle)

**IN n**
Number of structures in the array (size_t)

3.2.26 **Modex Structure**

The pmix_modex_data_t structure describes the business card exchange (BCX) information.

**Note:** This structure and its supporting macros have been deprecated and will be removed in future versions of the PMIx Standard.

```
PMIx v1.0
```

typedef struct pmix_modex_data {
    pmix_nspace_t nspace;
    int rank;
    uint8_t *blob;
    size_t size;
} pmix_modex_data_t;
3.2.27 Modex data structure support macros

The following macros are provided to support the `pmix_modex_t` structure.

### Initialize the `pmix_modex_t` structure

Initialize the `pmix_modex_t` fields

```c
PMIx v1.0

PMIX_MODEX_CONSTRUCT(m)
```

**IN** `m`

Pointer to the structure to be initialized (pointer to `pmix_modex_t`)

### Destruct the `pmix_modex_t` structure

Destruct the `pmix_modex_t` fields

```c
PMIx v1.0

PMIX_MODEX_DESTRUCT(m)
```

**IN** `m`

Pointer to the structure to be destructed (pointer to `pmix_modex_t`)

### Create a `pmix_modex_t` array

Allocate and initialize an array of `pmix_modex_t` structures

```c
PMIx v1.0

PMIX_MODEX_CREATE(m, n)
```

**INOUT** `m`

Address where the pointer to the array of `pmix_modex_t` structures shall be stored (handle)

**IN** `n`

Number of structures to be allocated (`size_t`)
3.2.27.4 Free a `pmix_modex_t` array

Release an array of `pmix_modex_t` structures

**PMIx v1.0**

```c
PMIX_MODEX_FREE(m, n)
```

**IN** `m`
- Pointer to the array of `pmix_modex_t` structures (handle)

**IN** `n`
- Number of structures in the array (`size_t`)

3.3 Data Packing/Unpacking Types and Structures

This section defines types and structures used to pack and unpack data passed through the PMIx API.

3.3.1 Byte Object Type

The `pmix_byte_object_t` structure describes a raw byte sequence.

**PMIx v1.0**

```c
typedef struct pmix_byte_object {
    char *bytes;
    size_t size;
} pmix_byte_object_t;
```

3.3.2 Byte object support macros

The following macros support the `pmix_byte_object_t` structure.

3.3.2.1 Initialize the `pmix_byte_object_t` structure

Initialize the `pmix_byte_object_t` fields

**PMIx v2.0**

```c
PMIX_BYTE_OBJECT_CONSTRUCT(m)
```

**IN** `m`
- Pointer to the structure to be initialized (pointer to `pmix_byte_object_t`)
3.3.2.2 Destruct the \texttt{pmix\_byte\_object\_t} structure

Clear the \texttt{pmix\_byte\_object\_t} fields

```c
PMIx v2.0
PMIX_BYTE_OBJECT_DESTRUCT(m)
```

\textbf{IN } \textit{m}

Pointer to the structure to be destructed (pointer to \texttt{pmix\_byte\_object\_t})

3.3.2.3 Create a \texttt{pmix\_byte\_object\_t} structure

Allocate and initialize an array of \texttt{pmix\_byte\_object\_t} structures

```c
PMIx v2.0
PMIX_BYTE_OBJECT_CREATE(m, n)
```

\textbf{INOUT } \textit{m}

Address where the pointer to the array of \texttt{pmix\_byte\_object\_t} structures shall be stored (handle)

\textbf{IN } \textit{n}

Number of structures to be allocated (\texttt{size\_t})

3.3.2.4 Free a \texttt{pmix\_byte\_object\_t} array

Release an array of \texttt{pmix\_byte\_object\_t} structures

```c
PMIx v2.0
PMIX_BYTE_OBJECT_FREE(m, n)
```

\textbf{IN } \textit{m}

Pointer to the array of \texttt{pmix\_byte\_object\_t} structures (handle)

\textbf{IN } \textit{n}

Number of structures in the array (\texttt{size\_t})
### 3.3.2.5 Load a `pmix_byte_object_t` structure

Load values into a `pmix_byte_object_t` structure.

```c
PMIx v2.0
PMIX_BYTE_OBJECT_LOAD(b, d, s)
```

- **IN b**
  - Pointer to the structure to be loaded (pointer to `pmix_byte_object_t`)

- **IN d**
  - Pointer to the data to be loaded (`char*`)

- **IN s**
  - Number of bytes in the data array (`size_t`)

### 3.3.3 Data Buffer Type

The `pmix_data_buffer_t` structure describes a data buffer used for packing and unpacking.

```c
PMIx v2.0
typedef struct pmix_data_buffer {
    /** Start of my memory */
    char *base_ptr;
    /** Where the next data will be packed to (within the allocated memory starting at base_ptr) */
    char *pack_ptr;
    /** Where the next data will be unpacked from (within the allocated memory starting as base_ptr) */
    char *unpack_ptr;
    /** Number of bytes allocated (starting at base_ptr) */
    size_t bytes_allocated;
    /** Number of bytes used by the buffer (i.e., amount of data -- including overhead -- packed in the buffer) */
    size_t bytes_used;
} pmix_data_buffer_t;
```

### 3.3.4 Data buffer support macros

The following macros support the `pmix_data_buffer_t` structure.
3.3.4.1 Initialize the `pmix_data_buffer_t` structure

Initialize the `pmix_data_buffer_t` fields

```
PMIx v2.0
PMIX_DATA_BUFFER_CONSTRUCT (m)
```

**IN** `m`

Pointer to the structure to be initialized (pointer to `pmix_data_buffer_t`)

3.3.4.2 Destruct the `pmix_data_buffer_t` structure

Clear the `pmix_data_buffer_t` fields

```
PMIx v2.0
PMIX_DATA_BUFFER_DESTRUCT (m)
```

**IN** `m`

Pointer to the structure to be destructed (pointer to `pmix_data_buffer_t`)

3.3.4.3 Create a `pmix_data_buffer_t` structure

Allocate and initialize a `pmix_data_buffer_t` structure

```
PMIx v2.0
PMIX_DATA_BUFFER_CREATE (m)
```

**INOUT** `m`

Address where the pointer to the `pmix_data_buffer_t` structure shall be stored (handle)

3.3.4.4 Free a `pmix_data_buffer_t`

Release a `pmix_data_buffer_t` structure

```
PMIx v2.0
PMIX_DATA_BUFFER_RELEASE (m)
```

**IN** `m`

Pointer to the `pmix_data_buffer_t` structure to be released (handle)
3.3.5 Data Array Structure

The `pmix_data_array_t` structure defines an array data structure.

```c
typedef struct pmix_data_array {
    pmix_data_type_t type;
    size_t size;
    void *array;
} pmix_data_array_t;
```

3.3.6 Generalized Data Types Used for Packing/Unpacking

The `pmix_data_type_t` structure is a `uint16_t` type for identifying the data type for packing/unpacking purposes.

Advice to PMIx library implementers

The following constants can be used to set a variable of the type `pmix_data_type_t`. Data types in the PMIx Standard are defined in terms of the C-programming language. Implementers wishing to support other languages should provide the equivalent definitions in a language-appropriate manner. Additionally, a PMIx implementation may choose to add additional types.

3.3.6.1 PMIx v1 Data Types

The following types were introduced in version 1 of the PMIx Standard.

```
PMIX_UNDEF     Undefined
PMIX_BOOL      Boolean (converted to/from native `true/false`) (`bool`)  
PMIX_BYTE      A byte of data (`uint8_t`)  
PMIX_STRING    NULL terminated string (`char*`)  
PMIX_SIZE      Size `size_t`
PMIX_PID       Operating process identifier (PID) (`pid_t`)  
PMIX_INT       Integer (int)  
PMIX_INT8      8-byte integer (`int8_t`)  
PMIX_INT16     16-byte integer (`int16_t`)  
PMIX_INT32     32-byte integer (`int32_t`)  
PMIX_INT64     64-byte integer (`int64_t`)  
PMIX_UINT      Unsigned integer (`unsigned int`)  
PMIX_UINT8     Unsigned 8-byte integer (`uint8_t`)  
```
PMIX_UINT16  Unsigned 16-byte integer (uint16_t)
PMIX_UINT32  Unsigned 32-byte integer (uint32_t)
PMIX_UINT64  Unsigned 64-byte integer (uint64_t)
PMIX_FLOAT   Float (float)
PMIX_DOUBLE  Double (double)
PMIX_TIMEVAL Time value (struct timeval)
PMIX_TIME    Time (time_t)
PMIX_VALUE   Value (pmix_value_t)
PMIX_PROC    Process (pmix_proc_t)
PMIX_APP     Application context
PMIX_INFO    Info object
PMIX_PDATA   Pointer to data
PMIX_BUFFER  Buffer
PMIX_BYTE_OBJECT   Byte object (pmix_byte_object_t)
PMIX_KVAL    Key/value pair
PMIX_MODEX (Deprecated in PMIx 2.0)   Modex
PMIX_PERSIST Persistance (pmix_persistence_t)
PMIX_INFO_ARRAY (Deprecated in PMIx 2.0) Info array

3.3.6.2 PMIx v2 Data Types

The following types were introduced in version 2 of the PMIx Standard.

PMIX_STATUS Status (pmix_status_t)
PMIX_POINTER Pointer (void*)
PMIX_SCOPE   Scope (pmix_scope_t)
PMIX_DATA_RANGE Data range (pmix_data_range_t)
PMIX_COMMAND Command
PMIX_INFO_DIRECTIVES Info directives
PMIX_DATA_TYPE Data type
PMIX_PROC_STATE Process state (pmix_proc_state_t)
PMIX_PROC_INFO Process info (pmix_proc_info_t)
PMIX_DATA_ARRAY Data array (pmix_data_array_t)
PMIX_PROC_RANK Process rank (pmix_rank_t)
PMIX_QUERY Query
PMIX_COMPRESSED_STRING Compressed string (with zlib)
PMIX_ALLOC_DIRECTIVE Allocation directive (pmix_alloc Directive_t)
PMIX_DATA_TYPE_MAX A boundary for implementers above which they can add their own
data types.
3.4 Reserved attributes

The PMIx standard defines a relatively small set of APIs and the caller may customize the behavior of the API by passing one or more attributes to that API. Additionally, attributes may be keys passed to `PMIx_Get` calls to access the specified values from the system.

Each attribute is represented by a key string, and a type for the associated value. This section defines a set of reserved keys which are prefixed with `pmix` to designate them as PMIx standard reserved keys. All definitions were introduced in version 1 of the standard unless otherwise marked.

Applications or associated libraries (e.g., MPI) may choose to define additional attributes. The attributes defined in this section are of the system and job as opposed to the attributes that the application (or associated libraries) might choose to expose. Due to this extensibility the `PMIx_Get` API will return `PMIX_ERR_NOT_FOUND` if the provided key cannot be found.

Attributes added in this version of the standard are shown in magenta to distinguish them from those defined in prior versions, which are shown in black. Deprecated attributes are shown in green and will be removed in future versions of the standard.

```
PMIX_ATTR_UNDEF NULL (NULL)
```

Constant representing an undefined attribute.

3.4.1 Initialization attributes

These attributes are defined to assist the caller with initialization.

```
PMIX_EVENT_BASE "pmix.evbase" (struct event_base *)
```

Pointer to libevent\footnote{http://libevent.org/} `event_base` to use in place of the internal progress thread.

```
PMIX_SERVER_TOOL_SUPPORT "pmix.srvr.tool" (bool)
```

The host RM wants to declare itself as willing to accept tool connection requests.

```
PMIX_SERVER_REMOTE_CONNECTIONS "pmix.srvr.remote" (bool)
```

Allow connections from remote tools. Forces the PMIx server to not exclusively use loopback device.

```
PMIX_SERVER_SYSTEM_SUPPORT "pmix.srvr.sys" (bool)
```

The host RM wants to declare itself as being the local system server for PMIx connection requests.

```
PMIX_SERVER_TMPDIR "pmix.srvr.tmpdir" (char*)
```

Top-level temporary directory for all client processes connected to this server, and where the PMIx server will place its tool rendezvous point and contact information.

```
PMIX_SYSTEM_TMPDIR "pmix.sys.tmpdir" (char*)
```

Temporary directory for this system, and where a PMIx server that declares itself to be a system-level server will place a tool rendezvous point and contact information.

```
PMIX_REGISTER_NODATA "pmix.reg.nodata" (bool)
```

Registration is for the namespace only. Do not copy job data.

```c
PMIX_SERVER_ENABLE_MONITORING "pmix.srv.monitor" (bool)
```
Enable PMIx internal monitoring by the PMIx server.

```c
PMIX_SERVER_NSPACE "pmix.srv.nspace" (char*)
```
Name of the namespace to use for this PMIx server.

```c
PMIX_SERVER_RANK "pmix.srv.rank" (pmix_rank_t)
```
Rank of this PMIx server

### 3.4.2 Tool-related attributes

These attributes are defined to assist PMIx-enabled tools to connect with the PMIx server.

```c
PMIX_TOOL_NSPACE "pmix.tool.nspace" (char*)
```
Name of the namespace to use for this tool.

```c
PMIX_TOOL_RANK "pmix.tool.rank" (uint32_t)
```
Rank of this tool.

```c
PMIX_SERVER_PIDINFO "pmix.srvr.pidinfo" (pid_t)
```
PID of the target PMIx server for a tool.

```c
PMIX_CONNECT_TO_SYSTEM "pmix.cnct.sys" (bool)
```
The requestor requires that a connection be made only to a local, system-level PMIx server.

```c
PMIX_CONNECT_SYSTEM_FIRST "pmix.cnct.sys.first" (bool)
```
Preferentially, look for a system-level PMIx server first.

```c
PMIX_SERVER_URI "pmix.srvr.uri" (char*)
```
uniform resource identifier (URI) of the PMIx server to be contacted.

```c
PMIX_SERVER_HOSTNAME "pmix.srvr.host" (char*)
```
Host where target PMIx server is located.

```c
PMIX_CONNECT_MAX_RETRIES "pmix.tool.mretries" (uint32_t)
```
Maximum number of times to try to connect to PMIx server.

```c
PMIX_CONNECT_RETRY_DELAY "pmix.tool.retry" (uint32_t)
```
Time in seconds between connection attempts to a PMIx server.

```c
PMIX_TOOL_DO_NOT_CONNECT "pmix.tool.nocon" (bool)
```
The tool wants to use internal PMIx support, but does not want to connect to a PMIx server.

### 3.4.3 Identification attributes

These attributes are defined to identify a process and it's associated PMIx-enabled library.

```c
PMIX_USERID "pmix.euid" (uint32_t)
```
Effective user id.

```c
PMIX_GRPID "pmix.egid" (uint32_t)
```
Effective group id.

```c
PMIX_DSTPATH "pmix.dstpath" (char*)
```
Path to shared memory data storage (dstore) files.
PMIX_VERSION_INFO "pmix.version" (char*)

PMIx version of contractor.

PMIX_PROGRAMMING_MODEL "pmix.pgm.model" (char*)

Programming model being initialized (e.g., “MPI” or “OpenMP”)

PMIX_MODEL_LIBRARY_NAME "pmix.mdl.name" (char*)

Programming model implementation ID (e.g., “OpenMPI” or “MPICH”)

PMIX_MODEL_LIBRARY_VERSION "pmix.mld.vrs" (char*)

Programming model version string (e.g., “2.1.1”)

PMIX_THREADING_MODEL "pmix.threads" (char*)

Threading model used (e.g., “pthreads”)

PMIX_REQUESTOR_IS_TOOL "pmix.req.tool" (bool)

The requesting process is a PMIx tool.

PMIX_REQUESTOR_IS_CLIENT "pmix.req.client" (bool)

The requesting process is a PMIx client.

3.4.4 UNIX socket rendezvous socket attributes

These attributes are used to describe a UNIX socket for rendezvous with the local RM.

PMIX_USOCK_DISABLE "pmix.usock.disable" (bool)

Disable legacy UNIX socket (usock) support

PMIX_SOCKET_MODE "pmix.sockmode" (uint32_t)

POSIX mode_t (9 bits valid)

PMIX_SINGLE_LISTENER "pmix.sing.listnr" (bool)

Use only one rendezvous socket, letting priorities and/or environment parameters select the active transport.

3.4.5 TCP connection attributes

These attributes are used to describe a TCP socket for rendezvous with the local RM.

PMIX_TCP_REPORT_URI "pmix.tcp.repuri" (char*)

If provided, directs that the TCP URI be reported and indicates the desired method of reporting: ‘-’ for stdout, ‘+’ for stderr, or filename.

PMIX_TCP_URI "pmix.tcp.uri" (char*)

The URI of the PMIx server to connect to, or a file name containing it in the form of file:<name of file containing it>.

PMIX_TCP_IF_INCLUDE "pmix.tcp.ifinclude" (char*)

Comma-delimited list of devices and/or Classless Inter-Domain Routing (CIDR) notation to include when establishing the TCP connection.

PMIX_TCP_IF_EXCLUDE "pmix.tcp.ifexclude" (char*)

Comma-delimited list of devices and/or CIDR notation to exclude when establishing the TCP connection.
3.4.6 Global Data Storage (GDS) attributes

These attributes are used to define the behavior of the GDS used to manage key/value pairs.

- **PMIX_GDS_MODULE**: "pmix.gds.mod" (char*)
  - Comma-delimited string of desired modules.

3.4.7 General process-level attributes

These attributes are used to define process attributes.

- **PMIX_CPUSET**: "pmix.cpuset" (char*)
  - hwloc\(^2\) bitmap to be applied to the process upon launch.
- **PMIX_CREDENTIAL**: "pmix.cred" (char*)
  - Security credential assigned to the process.
- **PMIX_SPAWNED**: "pmix.spawned" (bool)
  - true if this process resulted from a call to PMIx_Spawn.
- **PMIX_ARCH**: "pmix.arch" (uint32_t)
  - Architecture flag.

3.4.8 Scratch directory attributes

These attributes are used to define an application scratch directory.

- **PMIX_TMPDIR**: "pmix.tmpdir" (char*)
  - Full path to the top-level temporary directory assigned to the session.
- **PMIX_NS_DIR**: "pmix.nsdir" (char*)
  - Full path to the temporary directory assigned to the namespace, under PMIX_TMPDIR.
- **PMIX_PROC_DIR**: "pmix.pdir" (char*)
  - Full path to the subdirectory under PMIX_NS_DIR assigned to the process.
- **PMIX_TDIR_RMCLEAN**: "pmix.tdir.rmclean" (bool)
  - Resource Manager will clean session directories

\(^2\)https://www.open-mpi.org/projects/hwloc/
3.4.9 Relative Rank Descriptive Attributes

These attributes are used to describe information about relative ranks as assigned by the RM.

- **PMIX_PROCID** "pmix.procid" (pmix_proc_t)
  Process identifier
- **PMIX_NSPACE** "pmix.nspace" (char*)
  Namespace of the job.
- **PMIX_JOBID** "pmix.jobid" (char*)
  Job identifier assigned by the scheduler.
- **PMIX_APPNUM** "pmix.appnum" (uint32_t)
  Application number within the job.
- **PMIX_RANK** "pmix.rank" (pmix_rank_t)
  Process rank within the job.
- **PMIX_GLOBAL_RANK** "pmix.grank" (pmix_rank_t)
  Process rank spanning across all jobs in this session.
- **PMIX_APP_RANK** "pmix.apprank" (pmix_rank_t)
  Process rank within this application.
- **PMIX_NPROC_OFFSET** "pmix.offset" (pmix_rank_t)
  Starting global rank of this job.
- **PMIX_LOCAL_RANK** "pmix.lrank" (uint16_t)
  Local rank on this node within this job.
- **PMIX_NODE_RANK** "pmix.nrank" (uint16_t)
  Process rank on this node spanning all jobs.
- **PMIX_LOCALLLDR** "pmix.lldr" (pmix_rank_t)
  Lowest rank on this node within this job.
- **PMIX_APPLLDR** "pmix.aldr" (pmix_rank_t)
  Lowest rank in this application within this job.
- **PMIX_PROC_PID** "pmix.ppid" (pid_t)
  PID of specified process.
- **PMIX_SESSION_ID** "pmix.session.id" (uint32_t)
  Session identifier.
- **PMIX_NODE_LIST** "pmix.nlist" (char*)
  Comma-delimited list of nodes running processes for the specified namespace.
- **PMIX_ALLOCATED_NODELIST** "pmix.alist" (char*)
  Comma-delimited list of all nodes in this allocation regardless of whether or not they currently host processes.
- **PMIX_HOSTNAME** "pmix.hname" (char*)
  Name of the host where the specified process is running.
- **PMIX_NODEID** "pmix.nodeid" (uint32_t)
  Node identifier where the specified process is located, expressed as the node’s index (beginning at zero) in an array of nodes comprising the users allocation.
- **PMIX_LOCAL_PEERS** "pmix.lpeers" (char*)
Comma-delimited list of ranks on this node within the specified namespace.

**PMIX_LOCAL_PROCS** "pmix.lprocs" (pmix_proc_t array)
Array of pmix_proc_t of processes on the specified node.

**PMIX_LOCAL_CPUSETS** "pmix.lcpus" (char*)
Colon-delimited cpusets of local peers within the specified namespace.

**PMIX_PROC_URI** "pmix.puri" (char*)
URI containing contact information for a given process.

**PMIX_LOCALITY** "pmix.loc" (uint16_t)
Relative locality of two processes.

**PMIX_PARENT_ID** "pmix.parent" (pmix_proc_t)
Process identifier of the parent process of the calling process.

### 3.4.10 Size information attributes

These attributes are used to describe the size of various dimensions of the PMIx universe.

**PMIX_UNIV_SIZE** "pmix.univ.size" (uint32_t)
Number of processes in this namespace.

**PMIX_JOB_SIZE** "pmix.job.size" (uint32_t)
Number of processes in this job.

**PMIX_JOB_NUM_APPS** "pmix.job.napps" (uint32_t)
Number of applications in this job.

**PMIX_APP_SIZE** "pmix.app.size" (uint32_t)
Number of processes in this application.

**PMIX_LOCAL_SIZE** "pmix.local.size" (uint32_t)
Number of processes in this job on this node.

**PMIX_NODE_SIZE** "pmix.node.size" (uint32_t)
Number of processes across all jobs on this node.

**PMIX_MAX_PROCS** "pmix.max.size" (uint32_t)
Maximum number of processes for this job.

**PMIX_NUM_NODES** "pmix.num.nodes" (uint32_t)
Number of nodes in this namespace.

### 3.4.11 Memory information attributes

These attributes are used to describe memory available and used in the system.

**PMIX_AVAIL_PHYS_MEMORY** "pmix.pmem" (uint64_t)
Total available physical memory on this node.

**PMIX_DAEMON_MEMORY** "pmix.dmn.mem" (float)
Megabytes of memory currently used by the RM daemon.

**PMIX_CLIENT_AVG_MEMORY** "pmix.cl.mem.avg" (float)
Average Megabytes of memory used by client processes.
3.4.12 Topology information attributes

These attributes are used to describe topology information in the PMIx universe.

- **PMIX_NET_TOPO** "pmix.ntopo" (char*)
  eXtensible Markup Language (XML) representation of the network topology.

- **PMIX_LOCAL_TOPO** "pmix.ltopo" (char*)
  XML representation of local node topology.

- **PMIX_NODE_LIST** "pmix.nlist" (char*)
  Comma-delimited list of nodes running processes for this job.

- **PMIX_TOPOLOGY** "pmix.topo" (hwloc_topology_t)
  Pointer to the PMIx client’s internal hwloc topology object.

- **PMIX_TOPOLOGY_SIGNATURE** "pmix.toposig" (char*)
  Topology signature string.

- **PMIX_LOCALITY_STRING** "pmix.locstr" (char*)
  String describing a process’s bound location. The string is of the form:
  \texttt{NM}\%s:\texttt{SK}\%s:\texttt{L3}\%s:\texttt{L2}\%s:\texttt{L1}\%s:\texttt{CR}\%s:\texttt{HT}\%s
  Where the \%s is replaced with an integer index or inclusive range for hwloc. **NM** identifies
  the numa node(s). **SK** identifies the socket(s). **L3** identifies the L3 cache(s). **L2** identifies the
  L2 cache(s). **L1** identifies the L1 cache(s). **CR** identifies the cores(s). **HT** identifies the
  hardware thread(s). If your architecture does not have the specified hardware designation
  then it can be omitted from the signature.
  For example: \texttt{NM0:SK0:L30-4:L20-4:L10-4:CR0-4:HT0-39}.

  This means numa node 0, socket 0, L3 caches 0,1,2,3,4, L2 caches 0-4, L1 caches
  0-4, cores 0,1,2,3,4, and hardware threads 0-39.

- **PMIX_HWLOC_SHMEM_ADDR** "pmix.hwlocaddr" (size_t)
  Address of the hwloc shared memory segment.

- **PMIX_HWLOC_SHMEM_SIZE** "pmix.hwlocsize" (size_t)
  Size of the hwloc shared memory segment.

- **PMIX_HWLOC_SHMEM_FILE** "pmix.hwlocfile" (char*)
  Path to the hwloc shared memory file.

- **PMIX_HWLOC.XML_V1** "pmix.hwlocxml1" (char*)
  XML representation of local topology using hwloc’s v1.x format.

- **PMIX_HWLOC.XML_V2** "pmix.hwlocxml2" (char*)
  XML representation of local topology using hwloc’s v2.x format.

3.4.13 Request-related attributes

These attributes are used to influence the behavior of various PMIx operations.

- **PMIX_COLLECT_DATA** "pmix.collect" (bool)
  Collect data and return it at the end of the operation.

- **PMIX_TIMEOUT** "pmix.timeout" (int)
Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

**PMIX_IMMEDIATE** "pmix.immediate" (bool)
Estimated operation should immediately return an error from the PMIx server if the requested data cannot be found - do not request it from the host RM.

**PMIX_WAIT** "pmix.wait" (int)
Caller requests that the PMIx server wait until at least the specified number of values are found (0 indicates all and is the default).

**PMIX_COLLECTIVE_ALGO** "pmix.calgo" (char*)
Comma-delimited list of algorithms to use for the collective operation.

**PMIX_COLLECTIVE_ALGO_REQD** "pmix.calreqd" (bool)
If true, indicates that the requested choice of algorithm is mandatory.

**PMIX_NOTIFY_COMPLETION** "pmix.notecomp" (bool)
Notify the parent process upon termination of child job.

**PMIX_RANGE** "pmix.range" (pmix_data_range_t)
Value for calls to publish/lookup/unpublish or for monitoring event notifications.

**PMIX_PERSISTENCE** "pmix.persist" (pmix_persistence_t)
Value for calls to PMIx_Publish.

**PMIX_DATA_SCOPE** "pmix.scope" (pmix_scope_t)
Scope of the data to be found in a PMIx_Get call.

**PMIX_OPTIONAL** "pmix.optional" (bool)
Look only in the client’s local data store for the requested value - do not request data from the PMIx server if not found.

**PMIX_EMBED_BARRIER** "pmix.embed.barrier" (bool)
Execute a blocking fence operation before executing the specified operation. By default, PMIx_Finalize does not include an internal barrier operation. This attribute directs PMIx_Finalize to execute a barrier as part of the finalize operation.

**PMIX_JOB_TERM_STATUS** "pmix.job.term.status" (pmix_status_t)
Status to be returned upon job termination.

**PMIX_PROC_STATE_STATUS** "pmix.proc.state" (pmix_proc_state_t)
Process state

### 3.4.14 Server-to-PMIx library attributes

Attributes used by the host environment to pass data to its PMIx server library. The data will then be parsed and provided to the local PMIx clients.

**PMIX_REGISTER_NODATA** "pmix.reg.nodata" (bool)
Registration is for this namespace only, do not copy job data.

**PMIX_PROC_DATA** "pmix.pdata" (pmix_data_array_t)
Array of process data. Starts with rank, then contains more data.

**PMIX_NODE_MAP** "pmix.nmap" (char*)
Regular expression of nodes containing processes for this job.

PMIX_PROC_MAP "pmix.pmap" (char*)

Regular expression describing processes on each node within this job.

PMIX_ANL_MAP "pmix.anlmap" (char*)

Process mapping in Argonne National Laboratory’s PMI-1/PMI-2 notation.

PMIX_APP_MAP_TYPE "pmix.apmap.type" (char*)

Type of mapping used to layout the application (e.g., cyclic).

PMIX_APP_MAP_REGEX "pmix.apmap.regex" (char*)

Regular expression describing the result of the process mapping.

3.4.15 Server-to-Client attributes

Attributes used internally to communicate data from the PMIx server to the PMIx client.

PMIX_PROC_BLOB "pmix.pblob" (pmix_byte_object_t)

Packed blob of process data.

PMIX_MAP_BLOB "pmix.mblob" (pmix_byte_object_t)

Packed blob of process location.

3.4.16 Event handler registration and notification attributes

Attributes to support event registration and notification.

Advice to users

The event handler subsystem defined in the PMIx ad hoc version 1 Standard was completely overhauled in version 2 to resolve design flaws. Deprecated attributes shown below were therefore removed in the version 2 Standard.

PMIX_ERROR_NAME "pmix.errname" (pmix_status_t)

Specific error to be notified

PMIX_ERROR_GROUP_COMM "pmix.errgroup.comm" (bool)

Set true to get comm errors notification

PMIX_ERROR_GROUP_ABORT "pmix.errgroup.abort" (bool)

Set true to get abort errors notification

PMIX_ERROR_GROUP_MIGRATE "pmix.errgroup.migrate" (bool)

Set true to get migrate errors notification

PMIX_ERROR_GROUP_RESOURCE "pmix.errgroup.resource" (bool)

Set true to get resource errors notification

PMIX_ERROR_GROUP_SPAWN "pmix.errgroup.spawn" (bool)

Set true to get spawn errors notification

PMIX_ERROR_GROUP_NODE "pmix.errgroup.node" (bool)
Set true to get node status notification

PMIX_ERROR_GROUP_LOCAL "pmix.errgroup.local" (bool)
Set true to get local errors notification

PMIX_ERROR_GROUP_GENERAL "pmix.errgroup.gen" (bool)
Set true to get notified of generic errors

PMIX_ERROR_HANDLER_ID "pmix.errhandler.id" (int)
Errhandler reference id of notification being reported

PMIX_EVENT_HDLR_NAME "pmix.evname" (char*)
String name identifying this handler.

PMIX_EVENT_HDLR_FIRST "pmix.evfirst" (bool)
Invoke this event handler before any other handlers.

PMIX_EVENT_HDLR_LAST "pmix.evlast" (bool)
Invoke this event handler after all other handlers have been called.

PMIX_EVENT_HDLR_FIRST_IN_CATEGORY "pmix.evfirstcat" (bool)
Invoke this event handler before any other handlers in this category.

PMIX_EVENT_HDLR_LAST_IN_CATEGORY "pmix.evlastcat" (bool)
Invoke this event handler after all other handlers in this category have been called.

PMIX_EVENT_HDLR_BEFORE "pmix.evbefore" (char*)
Put this event handler immediately before the one specified in the (char*) value.

PMIX_EVENT_HDLR_AFTER "pmix.evafter" (char*)
Put this event handler immediately after the one specified in the (char*) value.

PMIX_EVENT_HDLR_PREPEND "pmix.evprepend" (bool)
Prepend this handler to the precedence list within its category.

PMIX_EVENT_HDLR_APPEND "pmix.evappend" (bool)
Append this handler to the precedence list within its category.

PMIX_EVENT_CUSTOM_RANGE "pmix.evrange" (pmix_data_array_t*)
Array of pmix_proc_t defining range of event notification.

PMIX_EVENT_AFFECTED_PROC "pmix.evproc" (pmix_proc_t)
The single process that was affected.

PMIX_EVENT_AFFECTED_PROCS "pmix.evaaffected" (pmix_data_array_t*)
Array of pmix_proc_t defining affected processes.

PMIX_EVENT_NON_DEFAULT "pmix.evnondef" (bool)
Event is not to be delivered to default event handlers.

PMIX_EVENT_RETURN_OBJECT "pmix.evobject" (void *)
Object to be returned whenever the registered callback function cbfunc is invoked. The object will only be returned to the process that registered it.

PMIX_EVENT_DO_NOT_CACHE "pmix.evnocache" (bool)
Instruct the PMIx server not to cache the event.

PMIX_EVENT_SILENT_TERMINATION "pmix.evsilentterm" (bool)
Do not generate an event when this job normally terminates.
3.4.17 Fault tolerance attributes

Attributes to support fault tolerance behaviors.

- **PMIX_EVENT_TERMINATE_SESSION** "pmix.evterm.sess" (bool)
  The RM intends to terminate this session.
- **PMIX_EVENT_TERMINATE_JOB** "pmix.evterm.job" (bool)
  The RM intends to terminate this job.
- **PMIX_EVENT_TERMINATE_NODE** "pmix.evterm.node" (bool)
  The RM intends to terminate all processes on this node.
- **PMIX_EVENT_TERMINATE_PROC** "pmix.evterm.proc" (bool)
  The RM intends to terminate just this process.
- **PMIX_EVENT_ACTION_TIMEOUT** "pmix.evtimeout" (int)
  The time in seconds before the RM will execute error response.
- **PMIX_EVENT_NO_TERMINATION** "pmix.evnoterm" (bool)
  Indicates that the handler has satisfactorily handled the event and believes termination of the application is not required.
- **PMIX_EVENT_WANT_TERMINATION** "pmix.evterm" (bool)
  Indicates that the handler has determined that the application should be terminated.

3.4.18 Spawn attributes

Attributes used to describe PMIx_Spawn behavior.

- **PMIX_PERSONALITY** "pmix.pers" (char*)
  Name of personality to use.
- **PMIX_HOST** "pmix.host" (char*)
  Comma-delimited list of hosts to use for spawned processes.
- **PMIX_HOSTFILE** "pmix.hostfile" (char*)
  Hostfile to use for spawned processes.
- **PMIX_ADD_HOST** "pmix.addhost" (char*)
  Comma-delimited list of hosts to add to the allocation.
- **PMIX_ADD_HOSTFILE** "pmix.addhostfile" (char*)
  Hostfile listing hosts to add to existing allocation.
- **PMIX_PREFIX** "pmix.prefix" (char*)
  Prefix to use for starting spawned processes.
- **PMIX_WDIR** "pmix.wdir" (char*)
  Working directory for spawned processes.
- **PMIX_MAPPER** "pmix.mapper" (char*)
  Mapping mechanism to use for placing spawned processes.
- **PMIX_DISPLAY_MAP** "pmix.dispmap" (bool)
  Display process mapping upon spawn.
- **PMIX_PPR** "pmix.ppr" (char*)
Number of processes to spawn on each identified resource.

PMIX_MAPBY "pmix.mapby" (char*)
Process mapping policy.

PMIX_RANKBY "pmix.rankby" (char*)
Process ranking policy.

PMIX_BINDTO "pmix.bindto" (char*)
Process binding policy.

PMIX_PRELOAD_BIN "pmix.preloadbin" (bool)
Preload binaries onto nodes.

PMIX_PRELOAD_FILES "pmix.preloadfiles" (char*)
Comma-delimited list of files to pre-position on nodes.

PMIX_NON_PMI "pmix.nopmi" (bool)
Spawned processes will not call PMIx_Init.

PMIX_STDIN_TGT "pmix.stdin" (uint32_t)
Spawned process rank that is to receive stdin.

PMIX_FWD_STDIN "pmix.fwd.stdin" (bool)
Forward this process’s stdin to the designated process.

PMIX_FWD_STDOUT "pmix.fwd.stdout" (bool)
Forward stdout from spawned processes to this process.

PMIX_FWD_STDERR "pmix.fwd.stderr" (bool)
Forward stderr from spawned processes to this process.

PMIX_DEBUGGER_DAEMONS "pmix.debugger" (bool)
Spawned application consists of debugger daemons.

PMIX_COSPAWN_APP "pmix.cospawn" (bool)
Designated application is to be spawned as a disconnected job. Meaning that it is not part of the “comm_world” of the parent process.

PMIX_SET_SESSION_CWD "pmix.ssncwd" (bool)
Set the application’s current working directory to the session working directory assigned by the RM.

PMIX_TAG_OUTPUT "pmix.tagout" (bool)
Tag application output with the identity of the source process.

PMIX_TIMESTAMP_OUTPUT "pmix.tsout" (bool)
Timestamp output from applications.

PMIX_MERGE_STDERR_STDOUT "pmix.mergeerrout" (bool)
Merge stdout and stderr streams from application processes.

PMIX_OUTPUT_TO_FILE "pmix.outfile" (char*)
Output application output to the specified file.

PMIX_INDEX_ARGV "pmix.indexargv" (bool)
Mark the argv with the rank of the process.

PMIX_CPUS_PER_PROC "pmix.cpuperproc" (uint32_t)
Number of cpus to assign to each rank.

PMIX_NO_PROCS_ON_HEAD "pmix.nolocal" (bool)
Do not place processes on the head node.
PMIX_NO_OVERSUBSCRIBE "pmix.noover" (bool)
  Do not oversubscribe the cpus.
PMIX_REPORT_BINDINGS "pmix.repbnd" (bool)
  Report bindings of the individual processes.
PMIX_CPU_LIST "pmix.cpulist" (char*)
  List of cpus to use for this job.
PMIX_JOB_RECOVERABLE "pmix.recover" (bool)
  Application supports recoverable operations.
PMIX_JOB_CONTINUOUS "pmix.continuous" (bool)
  Application is continuous, all failed processes should be immediately restarted.
PMIX_MAX_RESTARTS "pmix.maxrestarts" (uint32_t)
  Maximum number of times to restart a job.

3.4.19 Query attributes

Attributes used to describe PMIx_Query_info_nb behavior.

PMIX_QUERY_NAMESPACES "pmix.qry.ns" (char*)
  Request a comma-delimited list of active namespaces.
PMIX_QUERY_JOB_STATUS "pmix.qry.jst" (pmix_status_t)
  Status of a specified, currently executing job.
PMIX_QUERY_QUEUE_LIST "pmix.qry.qlst" (char*)
  Request a comma-delimited list of scheduler queues.
PMIX_QUERY_QUEUE_STATUS "pmix.qry.qst" (TBD)
  Status of a specified scheduler queue.
PMIX_QUERY_PROC_TABLE "pmix.qry.ptable" (char*)
  Input namespace of the job whose information is being requested returns (pmix_data_array_t) an array of pmix_proc_info_t.
PMIX_QUERY_LOCAL_PROC_TABLE "pmix.qry.lptable" (char*)
  Input namespace of the job whose information is being requested returns (pmix_data_array_t) an array of pmix_proc_info_t for processes in job on same node.
PMIX_QUERY_AUTHORIZATIONS "pmix.qry.auths" (bool)
  Return operations the PMIx tool is authorized to perform.
PMIX_QUERY_SPAWN_SUPPORT "pmix.qry.spawn" (bool)
  Return a comma-delimited list of supported spawn attributes.
PMIX_QUERY_DEBUG_SUPPORT "pmix.qry.debug" (bool)
  Return a comma-delimited list of supported debug attributes.
PMIX_QUERY_MEMORY_USAGE "pmix.qry.mem" (bool)
  Return information on memory usage for the processes indicated in the qualifiers.
PMIX_QUERY_LOCAL_ONLY "pmix.qry.local" (bool)
  Constrain the query to local information only.
PMIX_QUERY_REPORT_AVG "pmix.qry.avg" (bool)
Report average values.

```
PMIX_QUERY_REPORT_MINMAX "pmix.qry.minmax" (bool)
```

Report minimum and maximum values.

```
PMIX_QUERY_ALLOC_STATUS "pmix.query.alloc" (char*)
```

String identifier of the allocation whose status is being requested.

```
PMIX_TIME_REMAINING "pmix.time.remaining" (char*)
```

Query number of seconds (\texttt{uint32_t}) remaining in allocation for the specified namespace.

### 3.4.20 Log attributes

Attributes used to describe \texttt{PMIx\_Log\_nb} behavior.

```
PMIX_LOG_STDERR "pmix.log.stderr" (char*)
```

Log string to \texttt{stderr}.

```
PMIX_LOGSTDOUT "pmix.log.stdout" (char*)
```

Log string to stdout.

```
PMIX_LOG_SYSLOG "pmix.log.syslog" (char*)
```

Log data to syslog. Defaults to ERROR priority.

```
PMIX_LOG_MSG "pmix.log.msg" (pmix_byte_object_t)
```

Message blob to be sent somewhere.

```
PMIX_LOG_EMAIL "pmix.log.email" (pmix_data_array_t)
```

Log via email based on \texttt{pmix\_info\_t} containing directives.

```
PMIX_LOG_EMAIL_ADDR "pmix.log.emaddr" (char*)
```

Comma-delimited list of email addresses that are to receive the message.

```
PMIX_LOG_EMAIL_SUBJECT "pmix.log.emsub" (char*)
```

Subject line for email.

```
PMIX_LOG_EMAIL_MSG "pmix.log.emmsg" (char*)
```

Message to be included in email.

### 3.4.21 Debugger attributes

Attributes used to assist debuggers.

```
PMIX_DEBUG_STOP_ON_EXEC "pmix.dbg.exec" (bool)
```

Job is being spawned under debugger. The processes are instructed to pause on start.

```
PMIX_DEBUG_STOP_IN_INIT "pmix.dbg.init" (bool)
```

Instruct job to stop processes during \texttt{PMIx\_Init}.

```
PMIX_DEBUG_WAIT_FOR_NOTIFY "pmix.dbg.notify" (bool)
```

Block at desired point until receiving debugger release notification.

```
PMIX_DEBUG_JOB "pmix.dbg.job" (char*)
```

Namespace of the job to be debugged.

```
PMIX_DEBUG_WAITING_FOR_NOTIFY "pmix.dbg.waiting" (bool)
```

Job to be debugged is waiting for a release.
3.4.22 Resource manager attributes

Attributes used to describe the RM.

- **PMIX_RM_NAME** "pmix.rm.name" (char*)
  - String name of the RM.
- **PMIX_RM_VERSION** "pmix.rm.version" (char*)
  - RM version string.

3.4.23 Environment variable attributes

Attributes used to adjust environment variables.

- **PMIX_SET_ENVAR** "pmix.set.envar" (char*)
  - String “key=value” value shall be put into the environment.
- **PMIX_unset_ENVAR** "pmix.unset.envar" (char*)
  - Unset the environment variable specified in the string.

3.4.24 Job Allocation attributes

Attributes used to describe the job allocation.

- **PMIX_ALLOC_ID** "pmix.alloc.id" (char*)
  - Provide a string identifier for this allocation request which can later be used to query status of the request.
- **PMIX_ALLOC_NUM_NODES** "pmix.alloc.nnodes" (uint64_t)
  - The number of nodes.
- **PMIX_ALLOC_NODE_LIST** "pmix.alloc.nlist" (char*)
  - Regular expression of the specific nodes.
- **PMIX_ALLOC_NUM_CPUS** "pmix.alloc.ncpus" (uint64_t)
  - Number of cpus.
- **PMIX_ALLOC_NUM_CPU_LIST** "pmix.alloc.ncpulist" (char*)
  - Regular expression of the number of cpus for each node.
- **PMIX_ALLOC_CPU_LIST** "pmix.alloc.cpulist" (char*)
  - Regular expression of the specific cpus indicating the cpus involved.
- **PMIX_ALLOC_MEM_SIZE** "pmix.alloc.msize" (float)
  - Number of Megabytes.
- **PMIX_ALLOC_NETWORK** "pmix.alloc.net" (array)
  - Array of **pmix_info_t** describing requested network resources. If not given as part of an **pmix_info_t** struct that identifies the involved nodes, then the description will be applied across all nodes in the requestor's allocation.
- **PMIX_ALLOC_NETWORK_ID** "pmix.alloc.netid" (char*)
  - Name of the network.
- **PMIX_ALLOC_BANDWIDTH** "pmix.alloc.bw" (float)
Mbits/sec.

PMIX_ALLOC_NETWORK_QOS "pmix.alloc.netqos" (char*)
Quality of service level.

PMIX_ALLOC_TIME "pmix.alloc.time" (uint32_t)
Time in seconds.

### 3.4.25 Job control attributes

Attributes used to request control operations on an executing application.

PMIX_JOB_CTRL_ID "pmix.jctrl.id" (char*)
Provide a string identifier for this request.

PMIX_JOB_CTRL_PAUSE "pmix.jctrl.pause" (bool)
Pause the specified processes.

PMIX_JOB_CTRL_RESUME "pmix.jctrl.resume" (bool)
Resume (“un-pause”) the specified processes.

PMIX_JOB_CTRL_CANCEL "pmix.jctrl.cancel" (char*)
Cancel the specified request (NULL implies cancel all requests from this requestor).

PMIX_JOB_CTRL_KILL "pmix.jctrl.kill" (bool)
Forcibly terminate the specified processes and cleanup.

PMIX_JOB_CTRL_RESTART "pmix.jctrl.restart" (char*)
Restart the specified processes using the given checkpoint ID.

PMIX_JOB_CTRL_CHECKPOINT "pmix.jctrl.ckpt" (char*)
Checkpoint the specified processes and assign the given ID to it.

PMIX_JOB_CTRL_CHECKPOINT_EVENT "pmix.jctrl.ckptev" (bool)
Use event notification to trigger a process checkpoint.

PMIX_JOB_CTRL_CHECKPOINT_SIGNAL "pmix.jctrl.ckptsig" (int)
Use the given signal to trigger a process checkpoint.

PMIX_JOB_CTRL_CHECKPOINT_TIMEOUT "pmix.jctrl.ckptsig" (int)
Time in seconds to wait for a checkpoint to complete.

PMIX_JOB_CTRL_CHECKPOINT_METHOD
"pmix.jctrl.ckmethod" (pmix_data_array_t)
Array of pmix_info_t declaring each method and value supported by this application.

PMIX_JOB_CTRL_SIGNAL "pmix.jctrl.sig" (int)
Send given signal to specified processes.

PMIX_JOB_CTRL_PROVISION "pmix.jctrl.pvn" (char*)
Regular expression identifying nodes that are to be provisioned.

PMIX_JOB_CTRL_PROVISION_IMAGE "pmix.jctrl.pvnimg" (char*)
Name of the image that is to be provisioned.

PMIX_JOB_CTRL_PREEMPTIBLE "pmix.jctrl.preempt" (bool)
Indicate that the job can be pre-empted.

PMIX_JOB_CTRL_TERMINATE "pmix.jctrl.term" (bool)
Politely terminate the specified processes.
### 3.4.26 Monitoring attributes

Attributes used to control monitoring of an executing application.

- **PMIX_MONITOR_ID** "pmix.monitor.id" (char*)
  - Provide a string identifier for this request.

- **PMIX_MONITOR_CANCEL** "pmix.monitor.cancel" (char*)
  - Identifier to be canceled (NULL means cancel all monitoring for this process).

- **PMIX_MONITOR_APP_CONTROL** "pmix.monitor.appctrl" (bool)
  - The application desires to control the response to a monitoring event.

- **PMIX_MONITOR_HEARTBEAT** "pmix.monitor.mbeat" (void)
  - Register to have the PMIx server monitor the requestor for heartbeats.

- **PMIX_SEND_HEARTBEAT** "pmix.monitor.beat" (void)
  - Send heartbeat to local PMIx server.

- **PMIX_MONITOR_HEARTBEAT_TIME** "pmix.monitor.btime" (uint32_t)
  - Time in seconds before declaring heartbeat missed.

- **PMIX_MONITOR_HEARTBEAT_DROPS** "pmix.monitor.bdrop" (uint32_t)
  - Number of heartbeats that can be missed before generating the event.

- **PMIX_MONITOR_FILE** "pmix.monitor.fmon" (char*)
  - Register to monitor file for signs of life.

- **PMIX_MONITOR_FILE_SIZE** "pmix.monitor.fsize" (bool)
  - Monitor size of given file is growing to determine if the application is running.

- **PMIX_MONITOR_FILE_ACCESS** "pmix.monitor.faccess" (char*)
  - Monitor time since last access of given file to determine if the application is running.

- **PMIX_MONITOR_FILE_MODIFY** "pmix.monitor.fmod" (char*)
  - Monitor time since last modified of given file to determine if the application is running.

- **PMIX_MONITOR_FILE_CHECK_TIME** "pmix.monitor.ftime" (uint32_t)
  - Time in seconds between checking the file.

- **PMIX_MONITOR_FILE_DROPS** "pmix.monitor.fdrop" (uint32_t)
  - Number of file checks that can be missed before generating the event.

### 3.5 Callback Functions

PMIx provides blocking and nonblocking versions of most APIs. In the nonblocking versions, a callback is activated upon completion of the operation. This section describes many of those callbacks.
### 3.5.1 Release Callback Function

**Summary**

The `pmix_release_cbfunc_t` is used by the `pmix_modex_cbfunc_t` and `pmix_info_cbfunc_t` operations to indicate that the callback data may be reclaimed/freed by the caller.

**Format**

```c
typedef void (*pmix_release_cbfunc_t)(void *cbdata)
```

- **INOUT cbdata**
  - Callback data passed to original API call (memory reference)

**Description**

Since the data is “owned” by the host server, provide a callback function to notify the host server that we are done with the data so it can be released.

### 3.5.2 Modex Callback Function

**Summary**

The `pmix_modex_cbfunc_t` is used by the `pmix_server_fencenb_fn_t` and `pmix_server_dmodex_req_fn_t` PMIx server operations to return modex BCX data.

```c
typedef void (*pmix_modex_cbfunc_t)(pmix_status_t status, const char *data, size_t ndata, void *cbdata, pmix_release_cbfunc_t release_fn, void *release_cbdata)
```

- **IN status**
  - Status associated with the operation (handle)
- **IN data**
  - Data to be passed (pointer)
Description

A callback function that is solely used by PMIx servers, and not clients, to return modex BCX data in response to “fence” and “get” operations. The returned blob contains the data collected from each server participating in the operation.

3.5.3 Spawn Callback Function

Summary

The `pmix_spawn_cbfunc_t` is used on the PMIx client side by `PMIx_Spawn_nb` and on the PMIx server side by `pmix_server_spawn_fn_t`.

```c
typedef void (*pmix_spawn_cbfunc_t)(pmix_status_t status, pmix_nspace_t nspace, void *cbdata);
```

Description

The callback will be executed upon launch of the specified applications in `PMIx_Spawn_nb`, or upon failure to launch any of them.

The `status` of the callback will indicate whether or not the spawn succeeded. The `nspace` of the spawned processes will be returned, along with any provided callback data. Note that the returned `nspace` value will not be protected by the PRI upon return from the callback function, so the receiver must copy it if it needs to be retained.
### 3.5.4 Op Callback Function

**Summary**

The `pmix_op_cbfunc_t` is used by operations that simply return a status.

```c
typedef void (*pmix_op_cbfunc_t)(pmix_status_t status, void *cbdata);
```

**IN status**

Status associated with the operation (handle)

**IN cbdata**

Callback data passed to original API call (memory reference)

**Description**

Used by a wide range of PMIx API’s including `PMIx_Fence_nb`, `pmix_server_client_connected_fn_t`, `PMIx_server_register_nspace`. This callback function is used to return a status to an often nonblocking operation.

### 3.5.5 Lookup Callback Function

**Summary**

The `pmix_lookup_cbfunc_t` is used by `PMIx.Lookup_nb` to return data.

```c
typedef void (*pmix_lookup_cbfunc_t)(pmix_status_t status, pmix_pdata_t data[], size_t ndata, void *cbdata);
```

**IN status**

Status associated with the operation (handle)

**IN data**

Array of data returned (`pmix_pdata_t`)

**IN ndata**

Number of elements in the `data` array (`size_t`)

**IN cbdata**

Callback data passed to original API call (memory reference)
Description

A callback function for calls to `PMIx_Lookup_nb`. The function will be called upon completion of the command with the `status` indicating the success or failure of the request. Any retrieved data will be returned in an array of `pmix_pdata_t` structs. The namespace and rank of the process that provided each data element is also returned.

Note that these structures will be released upon return from the callback function, so the receiver must copy/protect the data prior to returning if it needs to be retained.

3.5.6 Value Callback Function

Summary

The `pmix_value_cbfunc_t` is used by `PMIx_Get_nb` to return data.

```c
typedef void (*pmix_value_cbfunc_t)(pmix_status_t status, pmix_value_t *kv, void *cbdata);
```

IN `status`  
Status associated with the operation (handle)

IN `kv`  
Key/value pair representing the data (`pmix_value_t`)

IN `cbdata`  
Callback data passed to original API call (memory reference)

Description

A callback function for calls to `PMIx_Get_nb`. The `status` indicates if the requested data was found or not. A pointer to the `pmix_value_t` structure containing the found data is returned. The pointer will be `NULL` if the requested data was not found.

3.5.7 Info Callback Function

Summary

The `pmix_info_cbfunc_t` is a general information callback used by various APIs.
typedef void (*pmix_info_cbfunc_t) (pmix_status_t status,
        pmix_info_t info[], size_t ninfo,
        void *cbdata,
        pmix_release_cbfunc_t release_fn,
        void *release_cbdata);

IN  status
    Status associated with the operation (pmix_status_t)
IN  info
    Array of pmix_info_t returned by the operation (pointer)
IN  ninfo
    Number of elements in the info array (size_t)
IN  cbdata
    Callback data passed to original API call (memory reference)
IN  release_fn
    Function to be called when done with the info data (function pointer)
IN  release_cbdata
    Callback data to be passed to release_fn (memory reference)

Description
The status indicates if requested data was found or not. An array of pmix_info_t will contain
the key/value pairs.

3.5.8 Event Handler Registration Callback Function

The pmix_evhdlr_reg_cbfunc_t callback function.

Advice to users
The PMIx ad hoc v1.0 Standard defined an error handler registration callback function with a
compatible signature, but with a different type definition function name
(pmix_errhandler_reg_cbfunc_t). It was removed from the v2.0 Standard and is not included in this
document to avoid confusion.

PMIx v2.0
typedef void (*pmix_evhdlr_reg_cbfunc_t)(pmix_status_t status,
   size_t evhdlr_ref,
   void *cbdata)

IN status
Status indicates if the request was successful or not (pmix_status_t)

IN evhdlr_ref
Reference assigned to the event handler by PMIx — this reference * must be used to
deregister the err handler (size_t)

IN cbdata
Callback data passed to original API call (memory reference)

Description
Define a callback function for calls to PMIx_Register_event_handler

### 3.5.9 Notification Handler Completion Callback Function

**Summary**
The `pmix_event_notification_cbfunc_fn_t` is called by event handlers to indicate
completion of their operations.

`PMIx v2.0`

typedef void (*pmix_event_notification_cbfunc_fn_t)(pmix_status_t status,
   pmix_info_t *results, size_t nresults,
   pmix_op_cbfunc_t cbfunc, void *thiscbdata,
   void *notification_cbdata);

IN status
Status returned by the event handler’s operation (pmix_status_t)

IN results
Results from this event handler’s operation on the event (pmix_info_t)

IN nresults
Number of elements in the results array (size_t)

IN cbfunc
`pmix_op_cbfunc_t` function to be executed when PMIx completes processing the
callback (function reference)
IN thiscbdata
Callback data that was passed in to the handler (memory reference)

IN cbdata
Callback data to be returned when PMIx executes cbfunc (memory reference)

**Description**

Define a callback by which an event handler can notify the PMIx library that it has completed its response to the notification. The handler is *required* to execute this callback so the library can determine if additional handlers need to be called. The handler shall return

`PMIX_ERR_EVENT_COMPLETE` if no further action is required. The return status of each event handler and any returned `pmix_info_t` structures will be added to the `results` array of `pmix_info_t` passed to any subsequent event handlers to help guide their operation.

If non-NULL, the provided callback function will be called to allow the event handler to release the provided info array and execute any other required cleanup operations.

### 3.5.10 Notification Function

#### Summary

The `pmix_notification_fn_t` is called by PMIx to deliver notification of an event.

```c
typedef void (size_t evhdlr_registration_id,
        pmix_status_t status,
        const pmix_proc_t *source,
        pmix_info_t info[], size_t ninfo,
        pmix_info_t results[], size_t nresults,
        pmix_event_notification_cbfunc_fn_t cbfunc,
        void *cbdata);
```
IN `evhdlr_registration_id`
Registration number of the handler being called (`size_t`)

IN `status`
Status associated with the operation (`pmix_status_t`)

IN `source`
Identifier of the process that generated the event (`pmix_proc_t`). If the source is the SMS, then the nspace will be empty and the rank will be `PMIX_RANK_UNDEF`

IN `info`
Information describing the event (`pmix_info_t`). This argument will be `NULL` if no additional information was provided by the event generator.

IN `ninfo`
Number of elements in the info array (`size_t`)

IN `results`
Aggregated results from prior event handlers servicing this event (`pmix_info_t`). This argument will be `NULL` if this is the first handler servicing the event, or if no prior handlers provided results.

IN `nresults`
Number of elements in the results array (`size_t`)

IN `cbfunc`
`pmix_event_notification_cbfunc_fn_t` callback function to be executed upon completion of the handler’s operation and prior to handler return (function reference).

IN `cbdata`
Callback data to be passed to cbfunc (memory reference)

Description

Note that different RMs may provide differing levels of support for event notification to application processes. Thus, the `info` array may be `NULL` or may contain detailed information of the event. It is the responsibility of the application to parse any provided info array for defined key-values if it so desires.

Advice to users

Possible uses of the `info` array include:

- for the host RM to alert the process as to planned actions, such as aborting the session, in response to the reported event
- provide a timeout for alternative action to occur, such as for the application to request an alternate response to the event
For example, the RM might alert the application to the failure of a node that resulted in termination of several processes, and indicate that the overall session will be aborted unless the application requests an alternative behavior in the next 5 seconds. The application then has time to respond with a checkpoint request, or a request to recover from the failure by obtaining replacement nodes and restarting from some earlier checkpoint.

Support for these options is left to the discretion of the host RM. Info keys are included in the common definitions above but may be augmented by environment vendors.

--- Advice to PMIx server hosts ---

On the server side, the notification function is used to inform the PMIx server library’s host of a detected event in the PMIx server library. Events generated by PMIx clients are communicated to the PMIx server library, but will be relayed to the host via the

`pmix_server_notify_event_fn_t` function pointer, if provided.

---

## 3.5.11 Server Setup Application Callback Function

The `PMIx_server_setup_application` callback function.

### Summary

Provide a function by which the resource manager can receive application-specific environmental variables and other setup data prior to launch of an application.
typedef void (*pmix_setup_application_cbfunc_t)(
    pmix_status_t status,
    pmix_info_t info[], size_t ninfo,
    void *provided_cbdata,
    pmix_op_cbfunc_t cbfunc, void *cbdata)

IN status
    returned status of the request (pmix_status_t)

IN info
    Array of info structures (array of handles)

IN ninfo
    Number of elements in the info array (integer)

IN provided_cbdata
    Data originally passed to call to PMIx_server_setup_application (memory reference)

IN cbfunc
    pmix_op_cbfunc_t function to be called when processing completed (function reference)

IN cbdata
    Data to be passed to the cbfunc callback function (memory reference)

Description
 Define a function to be called by the PMIx server library for return of application-specific setup
data in response to a request from the host RM. The returned info array is owned by the PMIx
server library and will be free’d when the provided cbfunc is called.

3.5.12 Server Direct Modex Response Callback Function

The PMIx_server_dmodex_request callback function.

Summary
 Provide a function by which the local PMIx server library can return connection and other data
posted by local application processes to the host resource manager.
Format

```
PMIx v1.0
```

```
typedef void (*pmix_dmodex_response_fn_t)(pmix_status_t status,
        char *data, size_t sz,
        void *cbdata);
```

| IN  | status                                               |
|     | Returned status of the request (pmix_status_t)       |
| IN  | data                                                 |
|     | Pointer to a data "blob" containing the requested information (handle) |
| IN  | sz                                                   |
|     | Number of bytes in the data blob (integer)           |
| IN  | cbdata                                               |
|     | Data passed into the initial call to PMIx_server_dmodex_request (memory reference) |

**Description**

Define a function to be called by the PMIx server library for return of information posted by a local application process (via PMIx_Put with subsequent PMIx_Commit) in response to a request from the host RM. The returned data blob is owned by the PMIx server library and will be free’d upon return from the function.

### 3.5.13 pmix_connection_cbfunc_t

**Summary**

Callback function for incoming connection request from a local client

Format

```
PMIx v1.0
```

```
typedef void (*pmix_connection_cbfunc_t)(
    int incoming_sd, void *cbdata)
```

| IN  | incoming_sd                                          |
|     | (integer)                                             |
| IN  | cbdata                                               |
|     | (memory reference)                                   |
Description
Callback function for incoming connection requests from local clients - only used by host environments that wish to directly handle socket connection requests.

3.5.14 pmix_tool_connection_cbfunc_t

Summary
Callback function for incoming tool connections.

Format

```
PMIx v2.0
typedef void (*pmix_tool_connection_cbfunc_t)(
    pmix_status_t status,
    pmix_proc_t *proc, void *cbdata)
```

IN status
    pmix_status_t value (handle)

IN proc
    pmix_proc_t structure containing the identifier assigned to the tool (handle)

IN cbdata
    Data to be passed (memory reference)

Description
Callback function for incoming tool connections. The host environment shall provide a namespace/rank identifier for the connecting tool.

Advice to PMIx server hosts
It is assumed that rank=0 will be the normal assignment, but allow for the future possibility of a parallel set of tools connecting, and thus each process requiring a unique rank.

3.5.15 Constant String Functions

Provide a string representation for several types of values. Note that the provided string is statically defined and must NOT be free'd.
Summary

String representation of a \texttt{pmix_status_t}.

\textit{PMIx v1.0} \hfill C \hfill ▼

\begin{verbatim}
const char*
PMIx_Error_string(pmix_status_t status);
\end{verbatim}

Summary

String representation of a \texttt{pmix_proc_state_t}.

\textit{PMIx v2.0} \hfill C \hfill ▼

\begin{verbatim}
const char*
PMIx_Proc_state_string(pmix_proc_state_t state);
\end{verbatim}

Summary

String representation of a \texttt{pmix_scope_t}.

\textit{PMIx v2.0} \hfill C \hfill ▼

\begin{verbatim}
const char*
PMIx_Scope_string(pmix_scope_t scope);
\end{verbatim}

Summary

String representation of a \texttt{pmix_persistence_t}.

\textit{PMIx v2.0} \hfill C \hfill ▼

\begin{verbatim}
const char*
PMIx_Persistence_string(pmix_persistence_t persist);
\end{verbatim}

Summary

String representation of a \texttt{pmix_data_range_t}.

\textit{PMIx v2.0} \hfill C \hfill ▼

\begin{verbatim}
const char*
PMIx_Data_range_string(pmix_data_range_t range);
\end{verbatim}
Summary

String representation of a `pmix_info_directives_t`.

```c
PMIx v2.0

const char*
PMIx_Info_directives_string(pmix_info_directives_t directives);
```

Summary

String representation of a `pmix_data_type_t`.

```c
PMIx v2.0

const char*
PMIx_Data_type_string(pmix_data_type_t type);
```

Summary

String representation of a `pmix_alloc_directive_t`.

```c
PMIx v2.0

const char*
PMIx_Alloc_directive_string(pmix_alloc_directive_t directive);
```
CHAPTER 4

Initialization and Finalization

The PMIx library is required to be initialized and finalized around the usage of most of the APIs. The APIs that may be used outside of the initialized and finalized region are noted. All other APIs must be used inside this region.

There are three sets of initialization and finalization functions depending upon the role of the process in the PMIx universe. Each of these functional sets are described in this chapter. Note that a process can only call one of the init/finalize functional pairs - e.g., a process that calls the client initialization function cannot also call the tool or server initialization functions, and must call the corresponding client finalize.

Advice to users

Processes that initialize as a server or tool automatically are given access to all client APIs. Server initialization includes setting up the infrastructure to support local clients - thus, it necessarily includes overhead and an increased memory footprint. Tool initialization automatically searches for a server to which it can connect — if declared as a launcher, the PMIx library sets up the required “hooks” for other tools (e.g., debuggers) to attach to it.

4.1 Query

The API defined in this section can be used by any PMIx process, regardless of their role in the PMIx universe.

4.1.1 PMIx_Initiated

Format

PMIx v1.0

int PMIx_Initiated(void)

C

A value of 1 (true) will be returned if the PMIx library has been initialized, and 0 (false) otherwise.

Rationale

The return value is an integer for historical reasons as that was the signature of prior PMI libraries.
4.1.2 PMIx_Get_version

**Summary**
Get the PMIx version information.

**Format**

```
PMIx v1.0
const char* PMIx_Get_version(void)
```

**Description**
Get the PMIx version string. Note that the provided string is statically defined and must not be free’d.

4.2 Client Initialization and Finalization

**Summary**
Initialization and finalization routines for PMIx clients.

**Advice to users**
The PMIx ad hoc v1.0 Standard defined the `PMIx_Init` function, but modified the function signature in the v1.2 version. The ad hoc v1.0 version is not included in this document to avoid confusion.

4.2.1 PMIx_Init

**Summary**
Initialize the PMIx client library
Format

PMIx v1.2

```c
pmix_status_t
PMIx_Init(pmix_proc_t *proc,
          pmix_info_t info[], size_t ninfo)
```

**INOUT** `proc`
- proc structure (handle)

**IN** `info`
- Array of `pmix_info_t` structures (array of handles)

**IN** `ninfo`
- Number of element in the `info` array (`size_t`)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

**Optional Attributes**

The following attributes are optional for implementers of PMIx libraries:

**PMIX_USOCK_DISABLE**  "pmix.usock.disable" (bool)
- Disable legacy UNIX socket (usock) support  If the library supports Unix socket connections, this attribute may be supported for disabling it.

**PMIX_SOCKET_MODE**  "pmix.sockmode" (uint32_t)
- POSIX `mode_t` (9 bits valid)  If the library supports socket connections, this attribute may be supported for setting the socket mode.

**PMIX_SINGLE_LISTENER**  "pmix.sing.listnr" (bool)
- Use only one rendezvous socket, letting priorities and/or environment parameters select the active transport.  If the library supports multiple methods for clients to connect to servers, this attribute may be supported for disabling all but one of them.

**PMIX_TCP_REPORT_URI**  "pmix.tcp.repuri" (char*)
- If provided, directs that the TCP URI be reported and indicates the desired method of reporting: ‘-’ for stdout, ’+’ for stderr, or filename.  If the library supports TCP socket connections, this attribute may be supported for reporting the URI.

**PMIX_TCP_IF_INCLUDE**  "pmix.tcp.ifinclude" (char*)
- Comma-delimited list of devices and/or CIDR notation to include when establishing the TCP connection.  If the library supports TCP socket connections, this attribute may be supported for specifying the interfaces to be used.

**PMIX_TCP_IF_EXCLUDE**  "pmix.tcp.ifexclude" (char*)
- Comma-delimited list of devices and/or CIDR notation to exclude when establishing the TCP connection.  If the library supports TCP socket connections, this attribute may be supported for specifying the interfaces that are not to be used.
**PMIX_TCP_IPV4_PORT** "pmix.tcp.ipv4" (int)

The IPv4 port to be used. If the library supports IPv4 connections, this attribute may be supported for specifying the port to be used.

**PMIX_TCP_IPV6_PORT** "pmix.tcp.ipv6" (int)

The IPv6 port to be used. If the library supports IPv6 connections, this attribute may be supported for specifying the port to be used.

**PMIX_TCP_DISABLE_IPV4** "pmix.tcp.disipv4" (bool)

Set to true to disable IPv4 family of addresses. If the library supports IPv4 connections, this attribute may be supported for disabling it.

**PMIX_TCP_DISABLE_IPV6** "pmix.tcp.disipv6" (bool)

Set to true to disable IPv6 family of addresses. If the library supports IPv6 connections, this attribute may be supported for disabling it.

**PMIX_EVENT_BASE** "pmix.evbase" (struct event_base *)

Pointer to libevent\(^1\) event_base to use in place of the internal progress thread.

**PMIX_GDS_MODULE** "pmix.gds.mod" (char*)

Comma-delimited string of desired modules. This attribute is specific to the PRI and controls only the selection of GDS module for internal use by the process. Module selection for interacting with the server is performed dynamically during the connection process.

---

**Description**

Initialize the PMIx client, returning the process identifier assigned to this client’s application in the provided pmix_proc_t struct. Passing a value of NULL for this parameter is allowed if the user wishes solely to initialize the PMIx system and does not require return of the identifier at that time.

When called, the PMIx client shall check for the required connection information of the local PMIx server and establish the connection. If the information is not found, or the server connection fails, then an appropriate error constant shall be returned.

If successful, the function shall return PMIX_SUCCESS and fill the proc structure (if provided) with the server-assigned namespace and rank of the process within the application. In addition, all startup information provided by the resource manager shall be made available to the client process via subsequent calls to PMIx_Get.

The PMIx client library shall be reference counted, and so multiple calls to PMIx_Init are allowed by the standard. Thus, one way for an application process to obtain its namespace and rank is to simply call PMIx_Init with a non-NULL proc parameter. Note that each call to PMIx_Init must be balanced with a call to PMIx_Finalize to maintain the reference count.

\(^{1}\)http://libevent.org/
Each call to `PMIx_Init` may contain an array of `pmix_info_t` structures passing directives to the PMIx client library as per the above attributes.

Multiple calls to `PMIx_Init` shall not include conflicting directives. The `PMIx_Init` function will return an error when directives that conflict with prior directives are encountered.

### 4.2.2 PMIx_Finalize

**Summary**

Finalize the PMIx client library.

**Format**

```
PMIx v1.0

pmix_status_t
PMIx_Finalize(const pmix_info_t info[], size_t ninfo)
```

<table>
<thead>
<tr>
<th>IN</th>
<th>info</th>
<th>Array of <code>pmix_info_t</code> structures (array of handles)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IN</td>
<td>ninfo</td>
<td>Number of element in the <code>info</code> array (<code>size_t</code>)</td>
</tr>
</tbody>
</table>

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

**Optional Attributes**

The following attributes are optional for implementers of PMIx libraries:

- **PMIX_EMBED_BARRIER** "pmix.embed.barrier" (bool)
  - Execute a blocking fence operation before executing the specified operation. By default, `PMIx_Finalize` does not include an internal barrier operation. This attribute directs `PMIx_Finalize` to execute a barrier as part of the finalize operation.

**Description**

Decrement the PMIx client library reference count. When the reference count reaches zero, the library will finalize the PMIx client, closing the connection with the local PMIx server and releasing all internally allocated memory.
4.3 Tool Initialization and Finalization

Initialization and finalization routines for PMIx tools.

4.3.1 PMIx_tool_init

Summary

Initialize the PMIx library for operating as a tool.

Format

```
PMIx v2.0

pmix_status_t PMIx_tool_init(pmix_proc_t *proc,
                           pmix_info_t info[], size_t ninfo)
```

**INOUT** proc

- pmix_proc_t structure (handle)

**IN** info

- Array of pmix_info_t structures (array of handles)

**IN** ninfo

- Number of element in the info array (size_t)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Required Attributes

The following attributes are required to be supported by all PMIx libraries:

- **PMIX_TOOL_NSSPACE** "pmix.tool.nspace" (char*)
  - Name of the namespace to use for this tool.

- **PMIX_TOOL_RANK** "pmix.tool.rank" (uint32_t)
  - Rank of this tool.

- **PMIX_TOOL_DO_NOT_CONNECT** "pmix.tool.nocon" (bool)
  - The tool wants to use internal PMIx support, but does not want to connect to a PMIx server.

- **PMIX_SERVER_URI** "pmix.srvr.uri" (char*)
  - URI of the PMIx server to be contacted.
Optional Attributes

The following attributes are optional for implementers of PMIx libraries:

**PMIX_CONNECT_TO_SYSTEM** "pmix.cnct.sys" (bool)
   The requestor requires that a connection be made only to a local, system-level PMIx server.

**PMIX_CONNECT_SYSTEM_FIRST** "pmix.cnct.sys.first" (bool)
   Preferentially, look for a system-level PMIx server first.

**PMIX_SERVER_PIDINFO** "pmix.srvr.pidinfo" (pid_t)
   PID of the target PMIx server for a tool.

**PMIX_TCP_URI** "pmix.tcp.uri" (char*)
   The URI of the PMIx server to connect to, or a file name containing it in the form of
   file:<name of file containing it>.

**PMIX_CONNECT_RETRY_DELAY** "pmix.tool.retry" (uint32_t)
   Time in seconds between connection attempts to a PMIx server.

**PMIX_CONNECT_MAX_RETRIES** "pmix.tool.mretries" (uint32_t)
   Maximum number of times to try to connect to PMIx server.

**PMIX_SOCKET_MODE** "pmix.sockmode" (uint32_t)
   POSIX mode_t (9 bits valid) If the library supports socket connections, this attribute may
   be supported for setting the socket mode.

**PMIX_TCP_REPORT_URI** "pmix.tcp.repuri" (char*)
   If provided, directs that the TCP URI be reported and indicates the desired method of
   reporting: '‐' for stdout, '+' for stderr, or filename. If the library supports TCP socket
   connections, this attribute may be supported for reporting the URI.

**PMIX_TCP_IF_INCLUDE** "pmix.tcp.ifinclude" (char*)
   Comma-delimited list of devices and/or CIDR notation to include when establishing the
   TCP connection. If the library supports TCP socket connections, this attribute may be
   supported for specifying the interfaces to be used.

**PMIX_TCP_IF_EXCLUDE** "pmix.tcp.ifexclude" (char*)
   Comma-delimited list of devices and/or CIDR notation to exclude when establishing the
   TCP connection. If the library supports TCP socket connections, this attribute may be
   supported for specifying the interfaces that are not to be used.

**PMIX_TCP_IPV4_PORT** "pmix.tcp.ipv4" (int)
   The IPv4 port to be used. If the library supports IPV4 connections, this attribute may be
   supported for specifying the port to be used.

**PMIX_TCP_IPV6_PORT** "pmix.tcp.ipv6" (int)
   The IPv6 port to be used. If the library supports IPV6 connections, this attribute may be
   supported for specifying the port to be used.
PMIX_TCP_DISABLE_IPV4  "pmix.tcp.disipv4" (bool)
    Set to true to disable IPv4 family of addresses. If the library supports IPV4 connections,
    this attribute may be supported for disabling it.

PMIX_TCP_DISABLE_IPV6  "pmix.tcp.disipv6" (bool)
    Set to true to disable IPv6 family of addresses. If the library supports IPV6 connections,
    this attribute may be supported for disabling it.

PMIX_EVENT_BASE  "pmix.evbase" (struct event_base *)
    Pointer to libevent\(^2\) event_base to use in place of the internal progress thread.

PMIX_GDS_MODULE  "pmix.gds.mod" (char*)
    Comma-delimited string of desired modules. This attribute is specific to the PRI and
    controls only the selection of GDS module for internal use by the process. Module selection
    for interacting with the server is performed dynamically during the connection process.

Description

Initialize the PMIx tool, returning the process identifier assigned to this tool in the provided
pmix_proc_t struct. The info array is used to pass user requests pertaining to the init and
subsequent operations. Passing a NULL value for the array pointer is supported if no directives are
desired.

If called with the PMIX_TOOL_DO_NOT_CONNECT attribute, the PMIx tool library will fully
initialize but not attempt to connect to a PMIx server. The tool can connect to a server at a later
point in time, if desired. In all other cases, the PMIx tool library will attempt to connect to
according to the following precedence chain:

- if PMIX_SERVER_URI or PMIX_TCP_URI is given, then connection will be attempted to the
  server at the specified URI. Note that it is an error for both of these attributes to be specified.
  PMIX_SERVER_URI is the preferred method as it is more generalized — PMIX_TCP_URI is
  provided for those cases where the user specifically wants to use a TCP transport for the
  connection and wants to error out if it isn’t available or cannot succeed. The PMIx library will
  return an error if connection fails — it will not proceed to check for other connection options as
  the user specified a particular one to use

- if PMIX_SERVER_PIDINFO was provided, then the tool will search under the directory
  provided by the PMIX_SERVER_TMPDIR environmental variable for a rendezvous file created
  by the process corresponding to that PID. The PMIx library will return an error if the rendezvous
  file cannot be found, or the connection is refused by the server

\(^2\)http://libevent.org/
• if `PMIX_CONNECT_TO_SYSTEM` is given, then the tool will search for a system-level rendezvous file created by a PMIx server in the directory specified by the `PMIX_SYSTEM_TMPDIR` environmental variable. If found, then the tool will attempt to connect to it. An error is returned if the rendezvous file cannot be found or the connection is refused.

• if `PMIX_CONNECT_SYSTEM_FIRST` is given, then the tool will search for a system-level rendezvous file created by a PMIx server in the directory specified by the `PMIX_SYSTEM_TMPDIR` environmental variable. If found, then the tool will attempt to connect to it. In this case, no error will be returned if the rendezvous file is not found or connection is refused — the PMIx library will silently continue to the next option.

• by default, the tool will search the directory tree under the directory provided by the `PMIX_SERVER_TMPDIR` environmental variable for rendezvous files of PMIx servers, attempting to connect to each it finds until one accepts the connection. If no rendezvous files are found, or all contacted servers refuse connection, then the PMIx library will return an error.

If successful, the function will return `PMIX_SUCCESS` and will fill the provided structure (if provided) with the server-assigned namespace and rank of the tool. Note that each connection attempt in the above precedence chain will retry (with delay between each retry) a number of times according to the values of the corresponding attributes. Default is no retries.

Note that the PMIx tool library is referenced counted, and so multiple calls to `PMIx_tool_init` are allowed. Thus, one way to obtain the namespace and rank of the process is to simply call `PMIx_tool_init` with a non-NULL parameter.

### 4.3.2 PMIx_tool_finalize

**Summary**

Finalize the PMIx library for a tool connection.

**Format**

```c
PMIx v2.0

pmix_status_t
PMIx_tool_finalize(void)
```

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

**Description**

Finalize the PMIx tool library, closing the connection to the server. An error code will be returned if, for some reason, the connection cannot be cleanly terminated — in this case, the connection is dropped.
Initialization and finalization routines for PMIx servers.

### 4.4.1 PMIx_server_init

**Summary**

Initialize the PMIx server.

**Format**

- **PMIx v1.0**

  ```c
  pmix_status_t
  PMIx_server_init(pmix_server_module_t *module,
                   pmix_info_t info[], size_t ninfo)
  ```

- **Required Attributes**

  The following attributes are required to be supported by all PMIx libraries:

  - **PMIX_SERVER_NSPECE**  "pmix.srv.nspace" (char*)
    Name of the namespace to use for this PMIx server.
  - **PMIX_SERVER_RANK**  "pmix.srv.rank" (pmix_rank_t)
    Rank of this PMIx server
  - **PMIX_SERVER_TMPDIR**  "pmix.srvr.tmpdir" (char*)
    Top-level temporary directory for all client processes connected to this server, and where the PMIx server will place its tool rendezvous point and contact information.
  - **PMIX_SYSTEM_TMPDIR**  "pmix.sys.tmpdir" (char*)
    Temporary directory for this system, and where a PMIx server that declares itself to be a system-level server will place a tool rendezvous point and contact information.
  - **PMIX_SERVER_TOOL_SUPPORT**  "pmix.srvr.tool" (bool)
The host RM wants to declare itself as willing to accept tool connection requests.

**PMIX_SERVER_SYSTEM_SUPPORT**  "pmix.srvr.sys"  (bool)

The host RM wants to declare itself as being the local system server for PMIx connection requests.

---

**Optional Attributes**

The following attributes are optional for implementers of PMIx libraries:

**PMIX_U SOCK_DISABLE**  "pmix.usock.disable"  (bool)

Disable legacy UNIX socket (usock) support. If the library supports Unix socket connections, this attribute may be supported for disabling it.

**PMIX_SOCKET_MODE**  "pmix.sockmode"  (uint32_t)

POSIX mode_t (9 bits valid). If the library supports socket connections, this attribute may be supported for setting the socket mode.

**PMIX_TCP_REPORT_URI**  "pmix.tcp.repuri"  (char*)

If provided, directs that the TCP URI be reported and indicates the desired method of reporting: ’-‘ for stdout, ’+‘ for stderr, or filename. If the library supports TCP socket connections, this attribute may be supported for reporting the URI.

**PMIX_TCP_IF_INCLUDE**  "pmix.tcp.ifinclude"  (char*)

Comma-delimited list of devices and/or CIDR notation to include when establishing the TCP connection. If the library supports TCP socket connections, this attribute may be supported for specifying the interfaces to be used.

**PMIX_TCP_IF_EXCLUDE**  "pmix.tcp.ifexclude"  (char*)

Comma-delimited list of devices and/or CIDR notation to exclude when establishing the TCP connection. If the library supports TCP socket connections, this attribute may be supported for specifying the interfaces that are not to be used.

**PMIX_TCP_IPV4_PORT**  "pmix.tcp.ipv4"  (int)

The IPv4 port to be used. If the library supports IPV4 connections, this attribute may be supported for specifying the port to be used.

**PMIX_TCP_IPV6_PORT**  "pmix.tcp.ipv6"  (int)

The IPv6 port to be used. If the library supports IPV6 connections, this attribute may be supported for specifying the port to be used.

**PMIX_TCP_DISABLE_IPV4**  "pmix.tcp.disipv4"  (bool)

Set to true to disable IPv4 family of addresses. If the library supports IPV4 connections, this attribute may be supported for disabling it.

**PMIX_TCP_DISABLE_IPV6**  "pmix.tcp.disipv6"  (bool)

Set to true to disable IPv6 family of addresses. If the library supports IPV6 connections, this attribute may be supported for disabling it.
**PMIX_SERVER_REMOTE_CONNECTIONS**  "pmix.srvr.remote" (bool)
Allow connections from remote tools. Forces the PMIx server to not exclusively use
loopback device. If the library supports connections from remote tools, this attribute may
be supported for enabling or disabling it.

**PMIX_EVENT_BASE**  "pmix.evbase" (struct event_base *)
Pointer to libevent\(^3\) event_base to use in place of the internal progress thread.

**PMIX_GDS_MODULE**  "pmix.gds.mod" (char*)
Comma-delimited string of desired modules. This attribute is specific to the PRI and
controls only the selection of GDS module for internal use by the process. Module selection
for interacting with the server is performed dynamically during the connection process.

**Description**
Initialize the PMIx server support library, and provide a pointer to a pmix_server_module_t
structure containing the caller’s callback functions. The array of pmix_info_t structs is used to
pass additional info that may be required by the server when initializing. For example, it may
include the PMIX_SERVER_TOOL_SUPPORT key, thereby indicating that the daemon is willing
to accept connection requests from tools.

**Advice to PMIx server hosts**
Providing a value of NULL for the module argument is permitted, as is passing an empty module
structure. Doing so indicates that the host environment will not provide support for multi-node
operations such as PMIx_Fence, but does intend to support local clients access to information.

### 4.4.2 PMIx_server_finalize

**Summary**
Finalize the PMIx server library.

**Format**

```
PMIx v1.0

pmix_status_t
PMIx_server_finalize(void)
```

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

\(^3\)http://libevent.org/
Description

Finalize the PMIx server support library, terminating all connections to attached tools and any local clients. All memory usage is released.
Management of key-value pairs in PMIx is a distributed responsibility. While the stated objective of the PMIx community is to eliminate collective operations, it is recognized that the traditional method of publishing/exchanging data must be supported until that objective can be met. This method relies on processes to discover and publish their local information which is collected by the local PMIx server library. Global exchange of the published information is then executed via a collective operation performed by the host SMS servers.

5.1 Setting and Accessing Key/Value Pairs

5.1.1 PMIx_Put

Summary

Push a key/value pair into the client’s namespace.

Format

```
PMIx v1.0
```

```
C
```

```

PMIx_Put(pmix_scope_t scope,
    const pmix_key_t key,
    pmix_value_t *val)
```

```

C
```

IN scope

Distribution scope of the provided value (handle)

IN key

key (pmix_key_t )

IN value

Reference to a pmix_value_t structure (handle)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.
Description

Push a value into the client’s namespace. The client’s PMIx library will cache the information locally until `PMIx_Commit` is called.

The provided `scope` is passed to the local PMIx server, which will distribute the data to other processes according to the provided scope. The `pmix_scope_t` values are defined in Section 3.2.9 on page 26. Specific implementations may support different scope values, but all implementations must support at least `PMIX_GLOBAL`.

The `pmix_value_t` structure supports both string and binary values. PMIx implementations will support heterogeneous environments by properly converting binary values between host architectures, and will copy the provided value into internal memory.

Advice to PMIx library implementers

The PMIx server library will properly pack/unpack data to accommodate heterogeneous environments. The host SMS is not involved in this action. The `value` argument must be copied - the caller is free to release it following return from the function.

Advice to users

The value is copied by the PMIx client library. Thus, the application is free to release and/or modify the value once the call to `PMIx_Put` has completed.

Note that keys starting with a string of “pmix” are exclusively reserved for the PMIx standard and must not be used in calls to `PMIx_Put`. Thus, applications should never use a defined “PMIX_” attribute as the key in a call to `PMIx_Put`.

5.1.2 PMIx_Get

Summary

Retrieve a key/value pair from the client’s namespace.
Format

```c
pmix_status_t
PMIx_Get(const pmix_proc_t *proc, const pmix_key_t key,
         const pmix_info_t info[], size_t ninfo,
         pmix_value_t **val)
```

**IN**  
**proc**  
process reference (handle)

**IN**  
**key**  
key to retrieve (pmix_key_t)

**IN**  
**info**  
Array of info structures (array of handles)

**IN**  
**ninfo**  
Number of element in the info array (integer)

**OUT**  
**val**  
value (handle)

Returns **PMIX_SUCCESS** or a negative value corresponding to a PMIx error constant.

---

**Required Attributes**

The following attributes are required to be supported by all PMIx libraries:

**PMIX_OPTIONAL** "pmix.optional" (bool)  
Look only in the client’s local data store for the requested value - do not request data from the PMIx server if not found.

**PMIX_IMMEDIATE** "pmix.immediate" (bool)  
Specified operation should immediately return an error from the PMIx server if the requested data cannot be found - do not request it from the host RM.

**PMIX_DATA_SCOPE** "pmix.scope" (pmix_scope_t)  
Scope of the data to be found in a PMIx_Get call.

---

**Optional Attributes**

The following attributes are optional for host environments:

**PMIX_TIMEOUT** "pmix.timeout" (int)  
Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.
Advice to PMIx library implementers

We recommend that implementation of the **PMIX_TIMEOUT** attribute be left to the host environment due to race condition considerations between delivery of the data by the host environment versus internal timeout in the PMIx server library. Implementers that choose to support **PMIX_TIMEOUT** directly in the PMIx server library must take care to resolve the race condition and should avoid passing **PMIX_TIMEOUT** to the host environment so that multiple competing timeouts are not created.

Description

Retrieve information for the specified *key* as published by the process identified in the given *pmix_proc_t*, returning a pointer to the value in the given address.

This is a blocking operation - the caller will block until either the specified data becomes available from the specified rank in the *proc* structure or the operation times out should the **PMIX_TIMEOUT** attribute have been given. The caller is responsible for freeing all memory associated with the returned *value* when no longer required.

The *info* array is used to pass user requests regarding the get operation.

Advice to users

Information provided by the PMIx server at time of process start is accessed by providing the namespace of the job with the rank set to **PMIX_RANK_WILDCARD**. The list of data referenced in this way is maintained on the PMIx web site at https://pmix.org/support/faq/wildcard-rank-access/ but includes items such as the number of processes in the namespace (**PMIX_JOB_SIZE**), total available slots in the allocation (**PMIX_UNIV_SIZE**), and the number of nodes in the allocation (**PMIX_NUM_NODES**).

In general, only data posted by a process via **PMIx_Put** needs to be retrieved by specifying the rank of the posting process. All other information is retrievable using a rank of **PMIX_RANK_WILDCARD**.

5.1.3 PMIx_Get_nb

Summary

Nonblocking **PMIx_Get** operation.
Format

```

PMIx v1.0

PMIx_get_nb(const pmix_proc_t *proc, const char key[],
             const pmix_info_t info[], size_t ninfo,
             pmix_value_cbfunc_t cbfunc, void *cbdata)
```

**IN proc**
- process reference (handle)

**IN key**
- key to retrieve (string)

**IN info**
- Array of info structures (array of handles)

**IN ninfo**
- Number of elements in the info array (integer)

**IN cbfunc**
- Callback function (function reference)

**IN cbdata**
- Data to be passed to the callback function (memory reference)

Returns **PMIX_SUCCESS** or a negative value corresponding to a PMIx error constant.

---

**Required Attributes**

The following attributes are required to be supported by all PMIx libraries:

**PMIX_OPTIONAL** "pmix.optional" (bool)
- Look only in the client’s local data store for the requested value - do not request data from the PMIx server if not found.

**PMIX_IMMEDIATE** "pmix.immediate" (bool)
- Specified operation should immediately return an error from the PMIx server if the requested data cannot be found - do not request it from the host RM.

**PMIX_DATA_SCOPE** "pmix.scope" (pmix_scope_t)
- Scope of the data to be found in a **PMIx_Get** call.

---

**Optional Attributes**

The following attributes are optional for host environments that support this operation:

**PMIX_TIMEOUT** "pmix.timeout" (int)
- Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.
Advice to PMIx library implementers

We recommend that implementation of the PMIX_TIMEOUT attribute be left to the host environment due to race condition considerations between delivery of the data by the host environment versus internal timeout in the PMIx server library. Implementers that choose to support PMIX_TIMEOUT directly in the PMIx server library must take care to resolve the race condition and should avoid passing PMIX_TIMEOUT to the host environment so that multiple competing timeouts are not created.

Description

The callback function will be executed once the specified data becomes available from the identified process and retrieved by the local server. The info array is used as described by the PMIx_Get routine.

Advice to users

Information provided by the PMIx server at time of process start is accessed by providing the namespace of the job with the rank set to PMIX_RANK_WILDCARD. The list of data referenced in this way is maintained on the PMIx web site at https://pmix.org/support/faq/wildcard-rank-access/ but includes items such as the number of processes in the namespace (PMIX_JOB_SIZE), total available slots in the allocation (PMIX_UNIV_SIZE), and the number of nodes in the allocation (PMIX_NUM_NODES).

In general, only data posted by a process via PMIx_Put needs to be retrieved by specifying the rank of the posting process. All other information is retrievable using a rank of PMIX_RANK_WILDCARD.

5.1.4 PMIx_Store_internal

Summary

Store some data locally for retrieval by other areas of the proc.
pmix_status_t PMIx_Store_internal(const pmix_proc_t *proc,
const pmix_key_t key,
  pmix_value_t *val);

IN  proc
    process reference (handle)

IN  key
    key to retrieve (string)

IN  val
    Value to store (handle)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Description
Store some data locally for retrieval by other areas of the proc. This is data that has only internal
scope - it will never be "pushed" externally.

5.2 Exchanging Key/Value Pairs

The APIs defined in this section push key/value pairs from the client to the local PMIx server, and
circulate the data between PMIx servers for subsequent retrieval by the local clients.

5.2.1 PMIx_Commit

Summary
Push all previously PMIx_Put values to the local PMIx server.

Format

pmix_status_t PMIx_Commit(void)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.
**Description**

This is an asynchronous operation. The PRI will immediately return to the caller while the data is transmitted to the local server in the background.

---

**Advice to users**

The local PMIx server will cache the information locally - i.e., the committed data will not be circulated during PMIx_Commit. Availability of the data upon completion of PMIx_Commit is therefore implementation-dependent.

---

**5.2.2 PMIx_Fence**

**Summary**

Execute a blocking barrier across the processes identified in the specified array, collecting information posted via PMIx_Put as directed.

**Format**

PMIx v1.0

```
C

pmix_status_t
PMIx_Fence(const pmix_proc_t procs[], size_t nprocs,
            const pmix_info_t info[], size_t ninfo)
```

**IN procs**

Array of pmix_proc_t structures (array of handles)

**IN nprocs**

Number of element in the procs array (integer)

**IN info**

Array of info structures (array of handles)

**IN ninfo**

Number of element in the info array (integer)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

---

**Required Attributes**

The following attributes are required to be supported by all PMIx libraries:

**PMIX_COLLECT_DATA** "pmix.collect" (bool)

Collect data and return it at the end of the operation.
Optional Attributes

The following attributes are optional for host environments:

1. **PMIX_TIMEOUT** "pmix.timeout" (int)
   - Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

2. **PMIX_COLLECTIVE_ALGO** "pmix.calgo" (char*)
   - Comma-delimited list of algorithms to use for the collective operation.

3. **PMIX_COLLECTIVE_ALGO_REQD** "pmix.calreqd" (bool)
   - If true, indicates that the requested choice of algorithm is mandatory.

Advice to PMIx library implementers

We recommend that implementation of the **PMIX_TIMEOUT** attribute be left to the host environment due to race condition considerations between completion of the operation versus internal timeout in the PMIx server library. Implementers that choose to support **PMIX_TIMEOUT** directly in the PMIx server library must take care to resolve the race condition and should avoid passing **PMIX_TIMEOUT** to the host environment so that multiple competing timeouts are not created.

Description

Passing a **NULL** pointer as the **procs** parameter indicates that the fence is to span all processes in the client’s namespace. Each provided **pmix_proc_t** struct can pass **PMIX_RANK_WILDCARD** to indicate that all processes in the given namespace are participating.

The **info** array is used to pass user requests regarding the fence operation.

Note that for scalability reasons, the default behavior for **PMIx_Fence** is to not collect the data.

5.2.3 PMIx_Fence_nb

Summary

Execute a nonblocking **PMIx_Fence** across the processes identified in the specified array of processes, collecting information posted via **PMIx_Put** as directed.
Format

PMIx v1.0

```
pmix_status_t
PMIx_Fence_nb(const pmix_proc_t procs[], size_t nprocs,
const pmix_info_t info[], size_t ninfo,
  pmix_op_cbfunc_t cbfunc, void *cbdata)
```

IN  procs
   Array of `pmix_proc_t` structures (array of handles)

IN  nprocs
   Number of element in the `procs` array (integer)

IN  info
   Array of info structures (array of handles)

IN  ninfo
   Number of element in the `info` array (integer)

IN  cbfunc
   Callback function (function reference)

IN  cbdata
   Data to be passed to the callback function (memory reference)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

---

**Required Attributes**

The following attributes are required to be supported by all PMIx libraries:

**PMIX_COLLECT_DATA**  "pmix.collect"  (bool)
   Collect data and return it at the end of the operation.

---

**Optional Attributes**

The following attributes are optional for host environments that support this operation:

**PMIX_TIMEOUT**  "pmix.timeout"  (int)
   Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hongs” due to programming errors that prevent the target process from ever exposing its data.

**PMIX_COLLECTIVE_ALGO**  "pmix.calgo"  (char*)
   Comma-delimited list of algorithms to use for the collective operation.

**PMIX_COLLECTIVE_ALGO_REQD**  "pmix.calreqd"  (bool)
   If `true`, indicates that the requested choice of algorithm is mandatory.
We recommend that implementation of the `PMIX_TIMEOUT` attribute be left to the host environment due to race condition considerations between completion of the operation versus internal timeout in the PMIx server library. Implementers that choose to support `PMIX_TIMEOUT` directly in the PMIx server library must take care to resolve the race condition and should avoid passing `PMIX_TIMEOUT` to the host environment so that multiple competing timeouts are not created.

Description

Nonblocking `PMIx_Fence` routine. Note that the function will return an error if a `NULL` callback function is given.

Note that for scalability reasons, the default behavior for `PMIx_Fence_nb` is to not collect the data.

5.3 Publishing and Lookup Data

The APIs defined in this section publish data from one client that can be later exchanged and looked up by another client.

PMIx libraries that support any of the functions in this section are required to support all of them.

Host environments that support any of the functions in this section are required to support all of them.

5.3.1 PMIx_Publish

Summary

Publish data for later access via `PMIx_Lookup`.

---

CHAPTER 5. KEY/VALUE MANAGEMENT

---
Format

```
PMIx v1.0
```

```
pmix_status_t
PMIx_Publish(const pmix_info_t info[], size_t ninfo)
```

<table>
<thead>
<tr>
<th>IN</th>
<th>info</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Array of info structures (array of handles)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>IN</th>
<th>ninfo</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Number of element in the <code>info</code> array (integer)</td>
</tr>
</tbody>
</table>

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing, and the PMIx library is required to add the `PMIX_USERID` and the `PMIX_GRPID` attributes of the client process that published the info.

Optional Attributes

The following attributes are optional for host environments that support this operation:

**PMIX_TIMEOUT** "pmix.timeout" (int)

Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

**PMIX_RANGE** "pmix.range" (pmix_data_range_t)

Value for calls to publish/lookup/unpublish or for monitoring event notifications.

**PMIX_PERSISTENCE** "pmix.persist" (pmix_persistence_t)

Value for calls to `PMIx_Publish`.

Advice to PMIx library implementers

We recommend that implementation of the `PMIX_TIMEOUT` attribute be left to the host environment due to race condition considerations between completion of the operation versus internal timeout in the PMIx server library. Implementers that choose to support `PMIX_TIMEOUT` directly in the PMIx server library must take care to resolve the race condition and should avoid passing `PMIX_TIMEOUT` to the host environment so that multiple competing timeouts are not created.
Description

Publish the data in the info array for subsequent lookup. By default, the data will be published into the PMIX_SESSION range and with PMIX_PERSIST_APP persistence. Changes to those values, and any additional directives, can be included in the pmix_info_t array. Attempts to access the data by processes outside of the provided data range will be rejected. The persistence parameter instructs the server as to how long the data is to be retained.

The blocking form will block until the server confirms that the data has been sent to the PMIx server and that it has obtained confirmation from its host SMS daemon that the data is ready to be looked up. Data is copied into the backing key-value data store, and therefore the info array can be released upon return from the blocking function call.

Advice to users

Duplicate keys within the specified data range may lead to unexpected behavior depending on host RM implementation of the backing key-value store.

Advice to PMIx library implementers

Implementations should, to the best of their ability, detect duplicate keys and protect the user from unexpected behavior - preferably returning an error. This version of the standard does not define a specific error code to be returned, so the implementation must make it clear to the user what to expect in this scenario. One suggestion is to define an RM specific error code beyond the PMIX_EXTERNAL_ERR_BASE boundary. Future versions of the standard will clarify that a specific PMIx error be returned when conflicting values are published for a given key, and will provide attributes to allow modified behaviors such as overwrite.

5.3.2 PMIx_Publish_nb

Summary

Nonblocking PMIx_Publish routine.
Format

PMIx Publish_nb(const pmix_info_t info[], size_t ninfo,
                 pmix_op_cbfunc_t cbfunc, void *cbdata)

IN info
   Array of info structures (array of handles)

IN ninfo
   Number of element in the info array (integer)

IN cbfunc
   Callback function pmix_op_cbfunc_t (function reference)

IN cbdata
   Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing, and the PMIx library is required to add the PMIX_USERID and the PMIX_GRPID attributes of the client process that published the info.

Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_TIMEOUT "pmix.timeout" (int)
   Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

PMIX_RANGE "pmix.range" (pmix_data_range_t)
   Value for calls to publish/lookup/unpublish or for monitoring event notifications.

PMIX_PERSISTENCE "pmix.persist" (pmix_persistence_t)
   Value for calls to PMIx_Publish.
Advice to PMIx library implementers

We recommend that implementation of the **PMIX_TIMEOUT** attribute be left to the host environment due to race condition considerations between completion of the operation versus internal timeout in the PMIx server library. Implementers that choose to support **PMIX_TIMEOUT** directly in the PMIx server library must take care to resolve the race condition and should avoid passing **PMIX_TIMEOUT** to the host environment so that multiple competing timeouts are not created.

Description

Nonblocking **PMIx_Publish** routine. The non-blocking form will return immediately, executing the callback when the PMIx server receives confirmation from its host SMS daemon.

Note that the function will return an error if a **NULL** callback function is given, and that the **info** array must be maintained until the callback is provided.

5.3.3 **PMIx_Lookup**

**Summary**

Lookup information published by this or another process with **PMIx_Publish** or **PMIx_Publish_nb**.

**Format**

```
PMIx v1.0

pmix_status_t
PMIx_Lookup(pmix_pdata_t data[], size_t ndata,
           const pmix_info_t info[], size_t ninfo)
```

**INOUT data**

Array of publishable data structures (array of handles)

**IN ndata**

Number of elements in the **data** array (integer)

**IN info**

Array of info structures (array of handles)

**IN ninfo**

Number of elements in the **info** array (integer)

Returns **PMIX_SUCCESS** or a negative value corresponding to a PMIx error constant.
Required Attributes

PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing, and the PMIx library is required to add the PMIX_USERID and the PMIX_GRPID attributes of the client process that is requesting the info.

Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_TIMEOUT "pmix.timeout" (int)
Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

PMIX_RANGE "pmix.range" (pmix_data_range_t)
Value for calls to publish/lookup/unpublish or for monitoring event notifications.

PMIX_WAIT "pmix.wait" (int)
Caller requests that the PMIx server wait until at least the specified number of values are found (0 indicates all and is the default).

Advice to PMIx library implementers

We recommend that implementation of the PMIX_TIMEOUT attribute be left to the host environment due to race condition considerations between completion of the operation versus internal timeout in the PMIx server library. Implementers that choose to support PMIX_TIMEOUT directly in the PMIx server library must take care to resolve the race condition and should avoid passing PMIX_TIMEOUT to the host environment so that multiple competing timeouts are not created.
Description

Lookup information published by this or another process. By default, the search will be conducted across the **PMIX_SESSION** range. Changes to the range, and any additional directives, can be provided in the **pmix_info_t** array.

Note that the search is also constrained to only data published by the current user (i.e., the search will not return data published by an application being executed by another user). There currently is no option to override this behavior - such an option may become available later via an appropriate **pmix_info_t** directive.

The *data* parameter consists of an array of **pmix_pdata_t** struct with the keys specifying the requested information. Data will be returned for each key in the associated *value* struct. Any key that cannot be found will return with a data type of **PMIX_UNDEF**. The function will return **PMIX_SUCCESS** if *any* values can be found, so the caller must check each data element to ensure it was returned.

The proc field in each **pmix_pdata_t** struct will contain the namespace/rank of the process that published the data.

Advice to users

Although this is a blocking function, it will *not* wait by default for the requested data to be published. Instead, it will block for the time required by the server to lookup its current data and return any found items. Thus, the caller is responsible for ensuring that data is published prior to executing a lookup, using **PMIX_WAIT** to instruct the server to wait for the data to be published, or for retrying until the requested data is found.

5.3.4 **PMIx_Lookup_nb**

Summary

Nonblocking version of **PMIx_Lookup**.
Format

PMIx v1.0

```c
pmix_status_t
PMIx_Lookup_nb(char **keys,
    const pmix_info_t info[], size_t ninfo,
    pmix_lookup_cbfunc_t cbfunc, void *cbdata)
```

IN keys
Array to be provided to the callback (array of strings)

IN info
Array of info structures (array of handles)

IN ninfo
Number of element in the info array (integer)

IN cbfunc
Callback function (handle)

IN cbdata
Callback data to be provided to the callback function (pointer)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing, and the PMIx library is required to add the PMIX_USERID and the PMIX_GRPID attributes of the client process that is requesting the info.

Optional Attributes

The following attributes are optional for host environments that support this operation:

**PMIX_TIMEOUT** "pmix.timeout" (int)
Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid "hangs" due to programming errors that prevent the target process from ever exposing its data.

**PMIX_RANGE** "pmix.range" (pmix_data_range_t)
Value for calls to publish/lookup/unpublish or for monitoring event notifications.

**PMIX_WAIT** "pmix.wait" (int)
Caller requests that the PMIx server wait until at least the specified number of values are found (0 indicates all and is the default).
Advice to PMIx library implementers

We recommend that implementation of the `PMIX_TIMEOUT` attribute be left to the host environment due to race condition considerations between completion of the operation versus internal timeout in the PMIx server library. Implementers that choose to support `PMIX_TIMEOUT` directly in the PMIx server library must take care to resolve the race condition and should avoid passing `PMIX_TIMEOUT` to the host environment so that multiple competing timeouts are not created.

Description

Non-blocking form of the `PMIx_Lookup` function. Data for the provided NULL-terminated `keys` array will be returned in the provided callback function. As with `PMIx_Lookup`, the default behavior is to not wait for data to be published. The `info` array can be used to modify the behavior as previously described by `PMIx_Lookup`. Both the `info` and `keys` arrays must be maintained until the callback is provided.

5.3.5 PMIx_Unpublish

Summary

Unpublish data posted by this process using the given keys.

Format

```c
PMIx v1.0

typedef pmix_status_t

PMIx_Unpublish(char **keys,
               const pmix_info_t info[], size_t ninfo)
```

**IN** info

Array of info structures (array of handles)

**IN** ninfo

Number of element in the `info` array (integer)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing, and the PMIx library is required to add the `PMIX_USERID` and the `PMIX_GRPID` attributes of the client process that is requesting the operation.
Optional Attributes

The following attributes are optional for host environments that support this operation:

`PMIX_TIMEOUT  "pmix.timeout" (int)`
Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

`PMIX_RANGE  "pmix.range" (pmix_data_range_t)`
Value for calls to publish/lookup/unpublish or for monitoring event notifications.

Advice to PMIx library implementers

We recommend that implementation of the `PMIX_TIMEOUT` attribute be left to the host environment due to race condition considerations between completion of the operation versus internal timeout in the PMIx server library. Implementers that choose to support `PMIX_TIMEOUT` directly in the PMIx server library must take care to resolve the race condition and should avoid passing `PMIX_TIMEOUT` to the host environment so that multiple competing timeouts are not created.

Description

Unpublish data posted by this process using the given keys. The function will block until the data has been removed by the server (i.e., it is safe to publish that key again). A value of `NULL` for the keys parameter instructs the server to remove all data published by this process.

By default, the range is assumed to be `PMIX_SESSION`. Changes to the range, and any additional directives, can be provided in the `info` array.

5.3.6 `PMIx_Unpublish_nb`

Summary

Nonblocking version of `PMIx_Unpublish`.
Minimum function call:

```c
pmix_status_t PMIx_Unpublish_nb(char **keys, const pmix_info_t info[], size_t ninfo, pmix_op_cbfunc_t cbfunc, void *cbdata)
```

**IN keys**
- (array of strings)

**IN info**
- Array of info structures (array of handles)

**IN ninfo**
- Number of element in the info array (integer)

**IN cbfunc**
- Callback function `pmix_op_cbfunc_t` (function reference)

**IN cbdata**
- Data to be passed to the callback function (memory reference)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

**Required Attributes**

PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing, and the PMIx library is required to add the `PMIX_USERID` and the `PMIX_GRPID` attributes of the client process that is requesting the operation.

**Optional Attributes**

The following attributes are optional for host environments that support this operation:

- **PMIX_TIMEOUT** "pmix.timeout" (int)
  - Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

- **PMIX_RANGE** "pmix.range" (pmix_data_range_t)
  - Value for calls to publish/lookup/unpublish or for monitoring event notifications.
Advice to PMIx library implementers

We recommend that implementation of the `PMIX_TIMEOUT` attribute be left to the host environment due to race condition considerations between completion of the operation versus internal timeout in the PMIx server library. Implementers that choose to support `PMIX_TIMEOUT` directly in the PMIx server library must take care to resolve the race condition and should avoid passing `PMIX_TIMEOUT` to the host environment so that multiple competing timeouts are not created.

Description

Non-blocking form of the `PMIx_Unpublish` function. The callback function will be executed once the server confirms removal of the specified data. The `info` array must be maintained until the callback is provided.
CHAPTER 6

Process Management

This chapter defines functionality used by clients to create and destroy/abort processes in the PMIx universe.

6.1 Abort

PMIx provides a dedicated API by which an application can request that specified processes be aborted by the system.

6.1.1 PMIx_Abort

Summary

Abort the specified processes

Format

```
PMIx v1.0

pmix_status_t
PMIx_Abort(int status, const char msg[],
           pmix_proc_t procs[], size_t nprocs)
```

IN status
Error code to return to invoking environment (integer)

IN msg
String message to be returned to user (string)

IN procs
Array of pmix_proc_t structures (array of handles)

IN nprocs
Number of elements in the procs array (integer)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.
Description

Request that the host resource manager print the provided message and abort the provided array of
procs. A Unix or POSIX environment should handle the provided status as a return error code from
the main program that launched the application. A NULL for the procs array indicates that all
processes in the caller’s namespace are to be aborted, including itself. Passing a NULL msg
parameter is allowed.

Advice to users

The response to this request is somewhat dependent on the specific resource manager and its
configuration (e.g., some resource managers will not abort the application if the provided status is
zero unless specifically configured to do so, and some cannot abort subsets of processes in an
application), and thus lies outside the control of PMIx itself. However, the PMIx client library shall
inform the RM of the request that the specified procs be aborted, regardless of the value of the
provided status.

Note that race conditions caused by multiple processes calling PMIx_Abort are left to the server
implementation to resolve with regard to which status is returned and what messages (if any) are
printed.

6.2 Process Creation

The PMIx_Spawn commands spawn new processes and/or applications in the PMIx universe.
This may include requests to extend the existing resource allocation or obtain a new one, depending
upon provided and supported attributes.

6.2.1 PMIx_Spawn

Summary

Spawn a new job.
Format

PMIx v1.0

```
void PMIx_Spawn(const pmix_info_t job_info[], size_t ninfo,
                const pmix_app_t apps[], size_t napps,
                char nspace[])
```

**IN** job_info
- Array of info structures (array of handles)

**IN** ninfo
- Number of elements in the job_info array (integer)

**IN** apps
- Array of pmix_app_t structures (array of handles)

**IN** napps
- Number of elements in the apps array (integer)

**OUT** nspace
- Namespace of the new job (string)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

**Required Attributes**

PMix libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing, and the PMIx library is required to add the following attributes to those provided before passing the request to the host:

- **PMIX_SPAWNED** "pmix.spawned" (bool)
  - true if this process resulted from a call to PMIx_Spawn.

- **PMIX_PARENT_ID** "pmix.parent" (pmix_proc_t)
  - Process identifier of the parent process of the calling process.

- **PMIX_REQUESTOR_IS_CLIENT** "pmix.req.client" (bool)
  - The requesting process is a PMIx client.

- **PMIX_REQUESTOR_IS_TOOL** "pmix.req.tool" (bool)
  - The requesting process is a PMIx tool.

Host environments that implement support for PMIx_Spawn are required to pass the PMIX_SPAWNED and PMIX_PARENT_ID attributes to all PMIx servers launching new child processes so those values can be returned to clients upon connection to the PMIx server. In addition, they are required to support the following attributes when present in either the job_info or the info array of an element of the apps array:

- **PMIX_WDIR** "pmix.wdir" (char*)
  - Working directory for spawned processes.
**PMIX_SET_SESSION_CWD** "pmix.ssncwd" (bool)

Set the application’s current working directory to the session working directory assigned by the RM.

**PMIX_PREFIX** "pmix.prefix" (char*)

Prefix to use for starting spawned processes.

**PMIX_HOST** "pmix.host" (char*)

Comma-delimited list of hosts to use for spawned processes.

**PMIX_HOSTFILE** "pmix.hostfile" (char*)

Hostfile to use for spawned processes.

---

The following attributes are optional for host environments that support this operation:

**PMIX_ADD_HOSTFILE** "pmix.addhostfile" (char*)

Hostfile listing hosts to add to existing allocation.

**PMIX_ADD_HOST** "pmix.addhost" (char*)

Comma-delimited list of hosts to add to the allocation.

**PMIX_PRELOAD_BIN** "pmix.preloadbin" (bool)

Preload binaries onto nodes.

**PMIX_PRELOAD_FILES** "pmix.preloadfiles" (char*)

Comma-delimited list of files to pre-position on nodes.

**PMIX_PERSONALITY** "pmix.pers" (char*)

Name of personality to use.

**PMIX_MAPPER** "pmix.mapper" (char*)

Mapping mechanism to use for placing spawned processes.

**PMIX_DISPLAY_MAP** "pmix.dispmap" (bool)

Display process mapping upon spawn.

**PMIX_PPR** "pmix.ppr" (char*)

Number of processes to spawn on each identified resource.

**PMIX_MAPBY** "pmix.mapby" (char*)

Process mapping policy.

**PMIX_RANKBY** "pmix.rankby" (char*)

Process ranking policy.

**PMIX_BINDTO** "pmix.bindto" (char*)

Process binding policy.

**PMIX_NON_PMI** "pmix.nonpmi" (bool)
Spawned processes will not call **PMIx_Init**.

**PMIX_STDIN_TGT** "pmix.stdin" (uint32_t)
Spawned process rank that is to receive stdin.

**PMIX_FWD_STDIN** "pmix.fwd.stdin" (bool)
Forward this process’s stdin to the designated process.

**PMIX_FWD_STDOUT** "pmix.fwd.stdout" (bool)
Forward stdout from spawned processes to this process.

**PMIX_FWD_STDERR** "pmix.fwd.stderr" (bool)
Forward stderr from spawned processes to this process.

**PMIX_DEBUGGER_DAEMONS** "pmix.debugger" (bool)
Spawned application consists of debugger daemons.

**PMIX_TAG_OUTPUT** "pmix.tagout" (bool)
Tag application output with the identity of the source process.

**PMIX_TIMESTAMP_OUTPUT** "pmix.tsout" (bool)
Timestamp output from applications.

**PMIX_MERGE_STDERR_STDOUT** "pmix.mergeerrout" (bool)
Merge stdout and stderr streams from application processes.

**PMIX_OUTPUT_TO_FILE** "pmix.outfile" (char*)
Output application output to the specified file.

**PMIX_INDEX_ARGV** "pmix.indxargv" (bool)
Mark the argv with the rank of the process.

**PMIX_CPUS_PER_PROC** "pmix.cpuperproc" (uint32_t)
Number of cpus to assign to each rank.

**PMIX_NO_PROCS_ON_HEAD** "pmix.nolocal" (bool)
Do not place processes on the head node.

**PMIX_NO_OVERSUBSCRIBE** "pmix.noover" (bool)
Do not oversubscribe the cpus.

**PMIX_REPORT_BINDINGS** "pmix.repbind" (bool)
Report bindings of the individual processes.

**PMIX_CPU_LIST** "pmix.cpulist" (char*)
List of cpus to use for this job.

**PMIX_JOB_RECOVERABLE** "pmix.recover" (bool)
Application supports recoverable operations.

**PMIX_JOB_CONTINUOUS** "pmix.continuous" (bool)
Application is continuous, all failed processes should be immediately restarted.
PMIX_MAX_RESTARTS "pmix.maxrestarts" (uint32_t)
Maximum number of times to restart a job.

Description

Spawn a new job. The assigned namespace of the spawned applications is returned in the nspace parameter. A NULL value in that location indicates that the caller doesn’t wish to have the namespace returned. The nspace array must be at least of size one more than PMIX_MAX_NSLEN.

By default, the spawned processes will be PMIx “connected” to the parent process upon successful launch (see PMIx_Connect description for details). Note that this only means that (a) the parent process will be given a copy of the new job’s information so it can query job-level info without incurring any communication penalties, (b) newly spawned child processes will receive a copy of the parent processes job-level info, and (c) both the parent process and members of the child job will receive notification of errors from processes in their combined assemblage.

Advice to users

Behavior of individual resource managers may differ, but it is expected that failure of any application process to start will result in termination/cleanup of all processes in the newly spawned job and return of an error code to the caller.

6.2.2 PMIx_Spawn_nb

Summary

Nonblocking version of the PMIx_Spawn routine.
Format

```c
pmix_status_t PMIx_Spawn_nb(const pmix_info_t job_info[], size_t ninfo,
                          const pmix_app_t apps[], size_t napps,
                          pmix_spawn_cbfunc_t cbfunc, void *cbdata)
```

IN  job_info
    Array of info structures (array of handles)

IN  ninfo
    Number of elements in the job_info array (integer)

IN  apps
    Array of pmix_app_t structures (array of handles)

IN  cbfunc
    Callback function pmix_spawn_cbfunc_t (function reference)

IN  cbdata
    Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are not required to directly support any attributes for this function. However, any
provided attributes must be passed to the host SMS daemon for processing, and the PMIx library is
required to add the following attributes to those provided before passing the request to the host:

- **PMIX_SPAWNED** "pmix.spawned" (bool)
  - true if this process resulted from a call to PMIx_Spawn.

- **PMIX_PARENT_ID** "pmix.parent" (pmix_proc_t)
  - Process identifier of the parent process of the calling process.

- **PMIX_REQUESTOR_IS_CLIENT** "pmix.req.client" (bool)
  - The requesting process is a PMIx client.

- **PMIX_REQUESTOR_IS_TOOL** "pmix.req.tool" (bool)
  - The requesting process is a PMIx tool.

Host environments that implement support for PMIx_Spawn are required to pass the
PMIX_SPAWNED and PMIX_PARENT_ID attributes to all PMIx servers launching new child
processes so those values can be returned to clients upon connection to the PMIx server. In
addition, they are required to support the following attributes when present in either the job_info or
the info array of an element of the apps array:

- **PMIX_WDIR** "pmix.wdir" (char*)
  - Working directory for spawned processes.
PMIX_SET_SESSION_CWD  "pmix.ssncwd" (bool)
    Set the application’s current working directory to the session working directory assigned by
    the RM.

PMIX_PREFIX  "pmix.prefix" (char*)
    Prefix to use for starting spawned processes.

PMIX_HOST  "pmix.host" (char*)
    Comma-delimited list of hosts to use for spawned processes.

PMIX_HOSTFILE  "pmix.hostfile" (char*)
    Hostfile to use for spawned processes.

---------------------------------------------------------------------------

Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_ADD_HOSTFILE  "pmix.addhostfile" (char*)
    Hostfile listing hosts to add to existing allocation.

PMIX_ADD_HOST  "pmix.addhost" (char*)
    Comma-delimited list of hosts to add to the allocation.

PMIX_PRELOAD_BIN  "pmix.preloadbin" (bool)
    Preload binaries onto nodes.

PMIX_PRELOAD_FILES  "pmix.preloadfiles" (char*)
    Comma-delimited list of files to pre-position on nodes.

PMIX_PERSONALITY  "pmix.pers" (char*)
    Name of personality to use.

PMIX_MAPPER  "pmix.mapper" (char*)
    Mapping mechanism to use for placing spawned processes.

PMIX_DISPLAY_MAP  "pmix.dispmap" (bool)
    Display process mapping upon spawn.

PMIX_PPR  "pmix.ppr" (char*)
    Number of processes to spawn on each identified resource.

PMIX_MAPBY  "pmix.mapby" (char*)
    Process mapping policy.

PMIX_RANKBY  "pmix.rankby" (char*)
    Process ranking policy.

PMIX_BINDTO  "pmix.bindto" (char*)
    Process binding policy.

PMIX_NON_PMI  "pmix.nonpmi" (bool)
Spawned processes will not call `PMIx_Init`.

`PMIX_STDIN_TGT "pmix.stdin" (uint32_t)`
Spawned process rank that is to receive `stdin`.

`PMIX_FWD_STDIN "pmix.fwd.stdin" (bool)`
Forward this process’s `stdin` to the designated process.

`PMIX_FWD_STDOUT "pmix.fwd.stdout" (bool)`
Forward `stdout` from spawned processes to this process.

`PMIX_FWD_STDERR "pmix.fwd.stderr" (bool)`
Forward `stderr` from spawned processes to this process.

`PMIX_DEBUGGER_DAEMONS "pmix.debugger" (bool)`
Spawned application consists of debugger daemons.

`PMIX_TAG_OUTPUT "pmix.tagout" (bool)`
Tag application output with the identity of the source process.

`PMIX_TIMESTAMP_OUTPUT "pmix.tsout" (bool)`
Timestamp output from applications.

`PMIX_MERGE_STDERR_STDOUT "pmix.mergeerrout" (bool)`
Merge `stdout` and `stderr` streams from application processes.

`PMIX_OUTPUT_TO_FILE "pmix.outfile" (char*)`
Output application output to the specified file.

`PMIX_INDEX_ARGV "pmix.indxargv" (bool)`
Mark the `argv` with the rank of the process.

`PMIX_CPUS_PER_PROC "pmix.cpuperproc" (uint32_t)`
Number of cpus to assign to each rank.

`PMIX_NO_PROCS_ON_HEAD "pmix.nolocal" (bool)`
Do not place processes on the head node.

`PMIX_NO_OVERSUBSCRIBE "pmix.noover" (bool)`
Do not oversubscribe the cpus.

`PMIX_REPORT_BINDINGS "pmix.repbind" (bool)`
Report bindings of the individual processes.

`PMIX_CPU_LIST "pmix.cpulist" (char*)`
List of cpus to use for this job.

`PMIX_JOB_RECOVERABLE "pmix.recover" (bool)`
Application supports recoverable operations.

`PMIX_JOB_CONTINUOUS "pmix.continuous" (bool)`
Application is continuous, all failed processes should be immediately restarted.
PMIX_MAX_RESTARTS "pmix.maxrestarts" (uint32_t)

Maximum number of times to restart a job.

Description

Nonblocking version of the PMIx_Spawn routine. The provided callback function will be executed upon successful start of all specified application processes.

Advice to users

Behavior of individual resource managers may differ, but it is expected that failure of any application process to start will result in termination/cleanup of all processes in the newly spawned job and return of an error code to the caller.

6.3 Connecting and Disconnecting Processes

This section defines functions to connect and disconnect processes in two or more separate PMIx namespaces. The PMIx definition of connected solely implies the following:

- job-level information for each namespace is to be made available to all processes in the connected assemblage
- any data posted by a process in the connected assemblage via calls to PMIx_Put and committed via PMIx_Commit is to be made accessible to all processes in the assemblage
- the host environment should treat the failure of any process in the assemblage as a reportable event, taking action on the assemblage as if it were a single application. For example, if the environment defaults (in the absence of any application directives) to terminating an application upon failure of any process in that application, then the environment should terminate all processes in the connected assemblage upon failure of any member.

Advice to PMIx server hosts

The host environment is not required to assign a new namespace to the connected assemblage, nor to assign new ranks for its members. However, it is required to generate a PMIX_ERR_INVALID_TERMINATION event should any process in the assemblage terminate or call PMIx_Finalize without first disconnecting from the assemblage.
Advice to users

Attempting to connect processes solely within the same namespace is essentially a no-op operation. While not explicitly prohibited, users are advised that a PMIx implementation or host environment may return an error in such cases.

The PMIx implementation is not required to provide any tracking support for the assemblage. Thus, the application is responsible for maintaining the membership list of the assemblage.

6.3.1 PMIx_Connect

Summary

Connect namespaces.

Format

PMIx v1.0

```
pmix_status_t
PMIx_Connect(const pmix_proc_t procs[], size_t nprocs,
             const pmix_info_t info[], size_t ninfo)
```

IN procs
Array of proc structures (array of handles)

IN nprocs
Number of elements in the procs array (integer)

IN info
Array of info structures (array of handles)

IN ninfo
Number of elements in the info array (integer)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing.
Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_TIMEOUT "pmix.timeout" (int)
Time in seconds before the specified operation should time out (0 indicating infinite) in
error. The timeout parameter can help avoid “hangs” due to programming errors that prevent
the target process from ever exposing its data.

PMIX_COLLECTIVE_ALGO "pmix.calgo" (char*)
Comma-delimited list of algorithms to use for the collective operation.

PMIX_COLLECTIVE_ALGO_REQD "pmix.calreqd" (bool)
If true, indicates that the requested choice of algorithm is mandatory.

Advice to PMIx library implementers

We recommend that implementation of the PMIX_TIMEOUT attribute be left to the host
environment due to race condition considerations between completion of the operation versus
internal timeout in the PMIx server library. Implementers that choose to support PMIX_TIMEOUT
directly in the PMIx server library must take care to resolve the race condition and should avoid
passing PMIX_TIMEOUT to the host environment so that multiple competing timeouts are not
created.

Description

Record the processes specified by the procs array as connected as per the PMIx definition. The
function will return once all processes identified in procs have called either PMix_Connect or
its non-blocking version, and the host environment has completed any supporting operations
required to meet the terms of the PMIx definition of connected processes.

Advice to users

All processes engaged in a given PMix_Connect operation must provide the identical procs
array as ordering of entries in the array and the method by which those processes are identified
(e.g., use of PMIX_RANK_WILDCARD versus listing the individual processes) may impact the
host environment’s algorithm for uniquely identifying an operation.
Processes that combine via \texttt{PMIx\_Connect} must call \texttt{PMIx\_Disconnect} prior to finalizing and/or terminating - any process in the assemblage failing to meet this requirement will cause a \texttt{PMIX\_ERR\_INVALID\_TERMINATION} event to be generated.

A process can only engage in \textit{one} connect operation involving the identical \texttt{procs} array at a time. However, a process \textit{can} be simultaneously engaged in multiple connect operations, each involving a different \texttt{procs} array.

As in the case of the \texttt{PMIx\_Fence} operation, the \texttt{info} array can be used to pass user-level directives regarding the algorithm to be used for any collective operation involved in the operation, timeout constraints, and other options available from the host RM.

### 6.3.2 \texttt{PMIx\_Connect\_nb}

#### Summary
Nonblocking \texttt{PMIx\_Connect\_nb} routine.

#### Format

\begin{verbatim}
PMIx v1.0

pmix_status_t
PMIx_Connect_nb(const pmix_proc_t procs[], size_t nprocs,
const pmix_info_t info[], size_t ninfo,
pmix_op_cbfunc_t cbfunc, void *cbdata)

IN    procs
Array of proc structures (array of handles)

IN    nprocs
Number of elements in the procs array (integer)

IN    info
Array of info structures (array of handles)

IN    ninfo
Number of element in the info array (integer)

IN    cbfunc
Callback function \texttt{pmix\_op\_cbfunc\_t} (function reference)

IN    cbdata
Data to be passed to the callback function (memory reference)

Returns \texttt{PMIX\_SUCCESS} or a negative value corresponding to a PMIx error constant.
\end{verbatim}
Required Attributes

PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing.

Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_TIMEOUT "pmix.timeout" (int)
   Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

PMIX_COLLECTIVE_ALGO "pmix.calgo" (char*)
   Comma-delimited list of algorithms to use for the collective operation.

PMIX_COLLECTIVE_ALGO_REQD "pmix.calreqd" (bool)
   If true, indicates that the requested choice of algorithm is mandatory.

Advice to PMIx library implementers

We recommend that implementation of the PMIX_TIMEOUT attribute be left to the host environment due to race condition considerations between completion of the operation versus internal timeout in the PMIx server library. Implementers that choose to support PMIX_TIMEOUT directly in the PMIx server library must take care to resolve the race condition and should avoid passing PMIX_TIMEOUT to the host environment so that multiple competing timeouts are not created.

Description

Nonblocking version of PMIx_Connect. The callback function is called once all processes identified in procs have called either PMIx_Connect or its non-blocking version, and the host environment has completed any supporting operations required to meet the terms of the PMIx definition of connected processes.

6.3.3 PMIx_Disconnect

Summary

Disconnect a previously connected set of processes.
Format

```
PMIx v1.0

pmix_status_t
PMIx_Disconnect(const pmix_proc_t procs[], size_t nprocs,
                 const pmix_info_t info[], size_t ninfo);
```

**IN procs**
Array of proc structures (array of handles)

**IN nprocs**
Number of elements in the `procs` array (integer)

**IN info**
Array of info structures (array of handles)

**IN ninfo**
Number of element in the `info` array (integer)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

**Required Attributes**

PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing.

**Optional Attributes**

The following attributes are optional for host environments that support this operation:

**PMIX_TIMEOUT** "pmix.timeout" (int)
Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

**Advice to PMIx library implementers**

We recommend that implementation of the `PMIX_TIMEOUT` attribute be left to the host environment due to race condition considerations between completion of the operation versus internal timeout in the PMIx server library. Implementers that choose to support `PMIX_TIMEOUT` directly in the PMIx server library must take care to resolve the race condition and should avoid passing `PMIX_TIMEOUT` to the host environment so that multiple competing timeouts are not created.
Description

Disconnect a previously connected set of processes. A **PMIX_ERR_INVALID_OPERATION** error will be returned if the specified set of `procs` was not previously connected via a call to **PMIx_Connect** or its non-blocking form. The function will return once all processes identified in `procs` have called either **PMIx_Disconnect** or its non-blocking version, and the host environment has completed any required supporting operations.

---

Advice to users

All processes engaged in a given **PMIx_Disconnect** operation must provide the identical `procs` array as ordering of entries in the array and the method by which those processes are identified (e.g., use of **PMIX_RANK_WILDCARD** versus listing the individual processes) may impact the host environment’s algorithm for uniquely identifying an operation.

A process can only engage in one disconnect operation involving the identical `procs` array at a time. However, a process can be simultaneously engaged in multiple disconnect operations, each involving a different `procs` array.

As in the case of the **PMIx_Fence** operation, the `info` array can be used to pass user-level directives regarding the algorithm to be used for any collective operation involved in the operation, timeout constraints, and other options available from the host RM.

6.3.4 **PMIx_Disconnect_nb**

Summary

Nonblocking **PMIx_Disconnect** routine.

Format

```
PMIx v1.0
```

```c
pmix_status_t
PMIx_Disconnect_nb(const pmix_proc_t procs[], size_t nprocs,
                   const pmix_info_t info[], size_t ninfo,
                   pmix_op_cbfunc_t cbfunc, void *cbdata);
```
IN  procs
    Array of proc structures (array of handles)
IN  nprocs
    Number of elements in the procs array (integer)
IN  info
    Array of info structures (array of handles)
IN  ninfo
    Number of element in the info array (integer)
IN  cbfunc
    Callback function pmix_op_cbfunc_t (function reference)
IN  cbdata
    Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are not required to directly support any attributes for this function. However, any
provided attributes must be passed to the host SMS daemon for processing.

Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_TIMEOUT "pmix.timeout" (int)
    Time in seconds before the specified operation should time out (0 indicating infinite) in
    error. The timeout parameter can help avoid “hangs” due to programming errors that prevent
    the target process from ever exposing its data.

Advice to PMIx library implementers

We recommend that implementation of the PMIX_TIMEOUT attribute be left to the host
environment due to race condition considerations between completion of the operation versus
internal timeout in the PMIx server library. Implementers that choose to support PMIX_TIMEOUT
directly in the PMIx server library must take care to resolve the race condition and should avoid
passing PMIX_TIMEOUT to the host environment so that multiple competing timeouts are not
created.

Description

Nonblocking PMIx_Disconnect routine. The callback function is called once all processes
identified in procs have called either PMIx_Disconnect_nb or its blocking version, and the
host environment has completed any required supporting operations.
CHAPTER 7

Job Allocation Management and Reporting

The job management APIs provide an application with the ability to orchestrate its operation in partnership with the SMS. Members of this category include the 

`PMIx_Allocation_request_nb`, `PMIx_Job_control_nb`, and 

`PMIx_Process_monitor_nb` APIs.

7.1 Query

As the level of interaction between applications and the host SMS grows, so too does the need for the application to query the SMS regarding its capabilities and state information. PMIx provides a generalized query interface for this purpose, along with a set of standardized attribute keys to support a range of requests. This includes requests to determine the status of scheduling queues and active allocations, the scope of API and attribute support offered by the SMS, namespaces of active jobs, location and information about a job’s processes, and information regarding available resources.

An example use-case for the `PMIx_Query_info_nb` API is to ensure clean job completion. Time-shared systems frequently impose maximum run times when assigning jobs to resource allocations. To shut down gracefully, e.g., to write a checkpoint before termination, it is necessary for an application to periodically query the resource manager for the time remaining in its allocation. This is especially true on systems for which allocation times may be shortened or lengthened from the original time limit. Many resource managers provide APIs to dynamically obtain this information, but each API is specific to the resource manager.

PMIx supports this use-case by defining an attribute key (`PMIX_TIME_REMAINING`) that can be used with the `PMIx_Query_info_nb` interface to obtain the number of seconds remaining in the current job allocation. Note that one could alternatively use the `PMIx_Register_event_handler` API to register for an event indicating incipient job termination, and then use the `PMIx_Job_control_nb` API to request that the host SMS generate an event a specified amount of time prior to reaching the maximum run time. PMIx provides such alternate methods as a means of maximizing the probability of a host system supporting at least one method by which the application can obtain the desired service.

The following APIs support query of various session and environment values.
7.1.1 PMIx.Resolve_peers

Summary

Obtain the array of processes within the specified namespace that are executing on a given node.

Format

\[ \text{PMIx v1.0} \]

\[
\begin{align*}
\text{pmix_status_t} & \quad \text{C} \\
\text{PMIx.Resolve_peers} & (\text{const char } * \text{nodename}, \\
& \quad \text{const pmix_nspace_t } \text{nspace}, \\
& \quad \text{pmix_proc_t } ** \text{procs}, \text{ size_t } * \text{nprocs}) \\
\end{align*}
\]

IN \quad \text{nodename} \\
Name of the node to query (string)

IN \quad \text{nspace} \\
namespace (string)

OUT \quad \text{procs} \\
Array of process structures (array of handles)

OUT \quad \text{nprocs} \\
Number of elements in the \text{procs} array (integer)

Returns \text{PMIX\_SUCCESS} or a negative value corresponding to a PMIx error constant.

Description

Given a \text{nodename}, return the array of processes within the specified \text{nspace} that are executing on that node. If the \text{nspace} is \text{NULL}, then all processes on the node will be returned. If the specified node does not currently host any processes, then the returned array will be \text{NULL}, and \text{nprocs} will be 0. The caller is responsible for releasing the \text{procs} array when done with it. The \text{PMIX\_PROC\_FREE} macro is provided for this purpose.

7.1.2 PMIx.Resolve_nodes

Summary

Return a list of nodes hosting processes within the given namespace.
**Format**

```
PMIx v1.0
```

```c
pmix_status_t
PMIx_Resolve_nodes(const char *nspace, char **nodelist)
```

**IN** `nspace`  
Namespace (string)

**OUT** `nodelist`  
Comma-delimited list of nodenames (string)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

**Description**

Given a `nspace`, return the list of nodes hosting processes within that namespace. The returned string will contain a comma-delimited list of nodenames. The caller is responsible for releasing the string when done with it.

### 7.1.3 PMIx_Query_info_nb

**Summary**

Query information about the system in general.

**Format**

```
PMIx v2.0
```

```c
pmix_status_t
PMIx_Query_info_nb(pmix_query_t queries[], size_t nqueries,
                   pmix_info_cbfunc_t cbfunc, void *cbdata)
```

**IN** `queries`  
Array of query structures (array of handles)

**IN** `nqueries`  
Number of elements in the `queries` array (integer)

**IN** `cbfunc`  
Callback function `pmix_info_cbfunc_t` (function reference)

**IN** `cbdata`  
Data to be passed to the callback function (memory reference)

Returns one of the following constants:
PMIX_SUCCESS  All data has been returned
PMIX_ERR_NOT_FOUND  None of the requested data was available
PMIX_ERR_PARTIAL_SUCCESS  Some of the data has been returned
PMIX_ERR_NOT_SUPPORTED  The host RM does not support this function

Required Attributes

PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing, and the PMIx library is required to add the PMIX_USERID and the PMIX_GRPID attributes of the client process making the request.

Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_QUERY_NAMESPACES  "pmix.qry.ns" (char*)
  Request a comma-delimited list of active namespaces.

PMIX_QUERY_JOB_STATUS  "pmix.qry.jst" (pmix_status_t)
  Status of a specified, currently executing job.

PMIX_QUERY_QUEUE_LIST  "pmix.qry.qlst" (char*)
  Request a comma-delimited list of scheduler queues.

PMIX_QUERY_QUEUE_STATUS  "pmix.qry.qst" (TBD)
  Status of a specified scheduler queue.

PMIX_QUERY_PROC_TABLE  "pmix.qry.ptable" (char*)
  Input namespace of the job whose information is being requested returns (pmix_data_array_t) an array of pmix_proc_info_t.

PMIX_QUERY_LOCAL_PROC_TABLE  "pmix.qry.lptable" (char*)
  Input namespace of the job whose information is being requested returns (pmix_data_array_t) an array of pmix_proc_info_t for processes in job on same node.

PMIX_QUERY_SPAWN_SUPPORT  "pmix.qry.spawn" (bool)
  Return a comma-delimited list of supported spawn attributes.

PMIX_QUERY_DEBUG_SUPPORT  "pmix.qry.debug" (bool)
  Return a comma-delimited list of supported debug attributes.

PMIX_QUERY_MEMORY_USAGE  "pmix.qry.mem" (bool)
  Return information on memory usage for the processes indicated in the qualifiers.

PMIX_QUERY_LOCAL_ONLY  "pmix.qry.local" (bool)
  Constrain the query to local information only.

PMIX_QUERY_REPORT_AVG  "pmix.qry.avg" (bool)
Report average values.

_PMX_QUERY_REPORT_MINMAX_ "pmix.qry.minmax" (bool)
Report minimum and maximum values.

_PMX_QUERYALLOC_STATUS_ "pmix.query.alloc" (char*)
String identifier of the allocation whose status is being requested.

_PMX_TIME_REMAINING_ "pmix.time.remaining" (char*)
Query number of seconds (uint32_t) remaining in allocation for the specified namespace.

Description
Query information about the system in general. This can include a list of active namespaces, network topology, etc. Also can be used to query node-specific info such as the list of peers executing on a given node. We assume that the host RM will exercise appropriate access control on the information.

NOTE: There is no blocking form of this API as the structures passed to query info differ from those for receiving the results.

The _status_ argument to the callback function indicates if requested data was found or not. An array of _pmix_info_t_ will contain each key that was provided and the corresponding value that was found. Requests for keys that are not found will return the key paired with a value of type _PMIX_UNDEF_.

Advice to users
The desire to query a list of attributes supported by the implementation and/or the host environment has been expressed and noted. The PMIx community is exploring the possibility and it will likely become available in a future release.
7.2 Allocation Requests

This section defines functionality to request new allocations from the RM, and request modifications to existing allocations. These are primarily used in the following scenarios:

- *Evolving* applications that dynamically request and return resources as they execute
- *Malleable* environments where the scheduler redirects resources away from executing applications for higher priority jobs or load balancing
- *Resilient* applications that need to request replacement resources in the face of failures
- *Rigid* jobs where the user has requested a static allocation of resources for a fixed period of time, but realizes that they underestimated their required time while executing

PMIx attempts to address this range of use-cases with a single, flexible API.

7.2.1 PMIx_Allocation_request_nb

Summary

Request an allocation operation from the host resource manager.

Format

```
PMIx v2.0

pmix_status_t
PMIx_Allocation_request_nb(pmix_alloc_directive_t directive,
             pmix_info_t info[], size_t ninfo,
             pmix_info_cbfunc_t cbfunc, void *cbdata);
```

- **IN** directive
  - Allocation directive (handle)
- **IN** info
  - Array of `pmix_info_t` structures (array of handles)
- **IN** ninfo
  - Number of elements in the `info` array (integer)
- **IN** cbfunc
  - Callback function `pmix_info_cbfunc_t` (function reference)
- **IN** cbdata
  - Data to be passed to the callback function (memory reference)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.
PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing, and the PMIx library is required to add the `PMIX_USERID` and the `PMIX_GRPID` attributes of the client process making the request.

Host environments that implement support for this operation are required to support the following attributes:

`PMIX_ALLOC_ID` "pmix.alloc.id" (char*)
  Provide a string identifier for this allocation request which can later be used to query status of the request.

`PMIX_ALLOC_NUM_NODES` "pmix.alloc.nnodes" (uint64_t)
  The number of nodes.

`PMIX_ALLOC_NUM_CPUS` "pmix.alloc.ncpus" (uint64_t)
  Number of cpus.

`PMIX_ALLOC_TIME` "pmix.alloc.time" (uint32_t)
  Time in seconds.

The following attributes are optional for host environments that support this operation:

`PMIX_ALLOC_NODE_LIST` "pmix.alloc.nlist" (char*)
  Regular expression of the specific nodes.

`PMIX_ALLOC_NUM_CPU_LIST` "pmix.alloc.ncpulist" (char*)
  Regular expression of the number of cpus for each node.

`PMIX_ALLOC_CPU_LIST` "pmix.alloc.cpulist" (char*)
  Regular expression of the specific cpus indicating the cpus involved.

`PMIX_ALLOC_MEM_SIZE` "pmix.alloc.msize" (float)
  Number of Megabytes.

`PMIX_ALLOC_NETWORK` "pmix.alloc.net" (array)
  Array of `pmix_info_t` describing requested network resources. If not given as part of an `pmix_info_t` struct that identifies the involved nodes, then the description will be applied across all nodes in the requestor’s allocation.

`PMIX_ALLOC_NETWORK_ID` "pmix.alloc.netid" (char*)
  Name of the network.

`PMIX_ALLOC_BANDWIDTH` "pmix.alloc.bw" (float)
  Mbits/sec.
**PMIX_ALLOC_NETWORK_QOS** "pmix.alloc.netqos" (char*)

Quality of service level.

---

**Description**

Request an allocation operation from the host resource manager. Several broad categories are envisioned, including the ability to:

- Request allocation of additional resources, including memory, bandwidth, and compute. This should be accomplished in a non-blocking manner so that the application can continue to progress while waiting for resources to become available. Note that the new allocation will be disjoint from (i.e., not affiliated with) the allocation of the requestor - thus the termination of one allocation will not impact the other.

- Extend the reservation on currently allocated resources, subject to scheduling availability and priorities. This includes extending the time limit on current resources, and/or requesting additional resources be allocated to the requesting job. Any additional allocated resources will be considered as part of the current allocation, and thus will be released at the same time.

- Return no-longer-required resources to the scheduler. This includes the “loan” of resources back to the scheduler with a promise to return them upon subsequent request.

### 7.2.2 PMIx_Job_control_nb

The PMIx_Job_control_nb API enables the application and SMS to coordinate the response to failures and other events. This can include requesting termination of the entire job or a subset of processes within a job, but can also be used in combination with other PMIx capabilities (e.g., allocation support and event notification) for more nuanced responses. For example, an application notified of an incipient over-temperature condition on a node could use the PMIx_Allocation_request_nb interface to request replacement nodes while simultaneously using the PMIx_Job_control_nb interface to direct that a checkpoint event be delivered to all processes in the application. If replacement resources are not available, the application might use the PMIx_Job_control_nb interface to request that the job continue at a lower power setting, perhaps sufficient to avoid the over-temperature failure.

The job control API can also be used by an application to register itself as available for preemption when operating in an environment such as a cloud or where incentives, financial or otherwise, are provided to jobs willing to be preempted. Registration can include attributes indicating how many resources are being offered for preemption (e.g., all or only some portion), whether the application will require time to prepare for preemption, etc. Jobs that request a warning will receive an event notifying them of an impending preemption (possibly including information as to the resources that will be taken away, how much time the application will be given prior to being preempted, whether the preemption will be a suspension or full termination, etc.) so they have an opportunity to save their work. Once the application is ready, it calls the provided event completion callback function to indicate that the SMS is free to suspend or terminate it, and can include directives regarding any desired restart.
Summary

Request a job control action.

Format

PMIx v2.0

```c
pmix_status_t
PMIx_Job_control_nb(const pmix_proc_t targets[], size_t ntargets,
                     const pmix_info_t directives[], size_t ndirs,
                     pmix_info_cbfunc_t cbfunc, void *cbdata)
```

**IN** targets

Array of proc structures (array of handles)

**IN** ntargets

Number of element in the targets array (integer)

**IN** directives

Array of info structures (array of handles)

**IN** ndirs

Number of element in the directives array (integer)

**IN** cbfunc

Callback function pmix_info_cbfunc_t (function reference)

**IN** cbdata

Data to be passed to the callback function (memory reference)

Returns **PMIX_SUCCESS** or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are not required to directly support any attributes for this function. However, any provided attributes must be passed to the host SMS daemon for processing, and the PMIx library is required to add the **PMIX_USERID** and the **PMIX_GRPID** attributes of the client process making the request.

Host environments that implement support for this operation are required to support the following attributes:

**PMIX_JOB_CTRL_ID**  "pmix.jctrl.id" (char*)

Provide a string identifier for this request.

**PMIX_JOB_CTRL_PAUSE**  "pmix.jctrl.pause" (bool)

Pause the specified processes.

**PMIX_JOB_CTRL_RESUME**  "pmix.jctrl.resume" (bool)

Resume (“un-pause”) the specified processes.

**PMIX_JOB_CTRL_KILL**  "pmix.jctrl.kill" (bool)
Forcibly terminate the specified processes and cleanup.

PMIX_JOB_CTRL_SIGNAL  "pmix.jctrl.sig" (int)
Send given signal to specified processes.

PMIX_JOB_CTRL_TERMINATE  "pmix.jctrl.term" (bool)
Politely terminate the specified processes.

Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_JOB_CTRL_CANCEL  "pmix.jctrl.cancel" (char*)
Cancel the specified request (NULL implies cancel all requests from this requestor).

PMIX_JOB_CTRL_RESTART  "pmix.jctrl.restart" (char*)
Restart the specified processes using the given checkpoint ID.

PMIX_JOB_CTRL_CHECKPOINT  "pmix.jctrl.ckpt" (char*)
Checkpoint the specified processes and assign the given ID to it.

PMIX_JOB_CTRL_CHECKPOINT_EVENT  "pmix.jctrl.ckptev" (bool)
Use event notification to trigger a process checkpoint.

PMIX_JOB_CTRL_CHECKPOINT_SIGNAL  "pmix.jctrl.ckptsig" (int)
Use the given signal to trigger a process checkpoint.

PMIX_JOB_CTRL_CHECKPOINT_TIMEOUT  "pmix.jctrl.ckptsig" (int)
Time in seconds to wait for a checkpoint to complete.

PMIX_JOB_CTRL_CHECKPOINT_METHOD  "pmix.jctrl.ckmethod" (pmix_data_array_t)
Array of pmix_info_t declaring each method and value supported by this application.

PMIX_JOB_CTRL_PROVISION  "pmix.jctrl.pvn" (char*)
Regular expression identifying nodes that are to be provisioned.

PMIX_JOB_CTRL_PROVISION_IMAGE  "pmix.jctrl.pvnimg" (char*)
Name of the image that is to be provisioned.

PMIX_JOB_CTRL_PREEMPTIBLE  "pmix.jctrl.preempt" (bool)
Indicate that the job can be pre-empted.
Description

Request a job control action. The targets array identifies the processes to which the requested job control action is to be applied. A NULL value can be used to indicate all processes in the caller's namespace. The use of PMIX_RANK_WILDARD can also be used to indicate that all processes in the given namespace are to be included.

The directives are provided as pmix_info_t structures in the directives array. The callback function provides a status to indicate whether or not the request was granted, and to provide some information as to the reason for any denial in the pmix_info_cbfunc_t array of pmix_info_t structures.

7.3 Process and Job Monitoring

In addition to external faults, a common problem encountered in HPC applications is a failure to make progress due to some internal conflict in the computation. These situations can result in a significant waste of resources as the SMS is unaware of the problem, and thus cannot terminate the job. Various watchdog methods have been developed for detecting this situation, including requiring a periodic “heartbeat” from the application and monitoring a specified file for changes in size and/or modification time.

At the request of SMS vendors and members, a monitoring support interface has been included in the PMIx v2 standard. The defined API allows applications to request monitoring, directing what is to be monitored, the frequency of the associated check, whether or not the application is to be notified (via the event notification subsystem) of stall detection, and other characteristics of the operation. In addition, heartbeat and file monitoring methods have been included in the PRI but are active only when requested.

7.3.1 PMIx_Process_monitor_nb

Summary

Request that application processes be monitored.

Format

```
PMIx v2.0

pmix_status_t
PMIx_Process_monitor_nb(const pmix_info_t *monitor, pmix_status_t error,
    const pmix_info_t directives[], size_t ndirs,
    pmix_info_cbfunc_t cbfunc, void *cbdata)
```
IN monitor
  info (handle)
IN error
  status (integer)
IN directives
  Array of info structures (array of handles)
IN ndirs
  Number of elements in the directives array (integer)
IN cbfunc
  Callback function pmix_info_cbfunc_t (function reference)
IN cbdata
  Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Optional Attributes

The following attributes may be implemented by a PMIx library or by the host environment. If supported by the PMIx server library, then the library must not pass the supported attributes to the host environment. All attributes not directly supported by the server library must be passed to the host environment if it supports this operation, and the library is required to add the PMIX_USERID and the PMIX_GRPID attributes of the requesting process:

PMIX_MONITOR_ID "pmix.monitor.id" (char*)
  Provide a string identifier for this request.
PMIX_MONITOR_CANCEL "pmix.monitor.cancel" (char*)
  Identifier to be canceled (NULL means cancel all monitoring for this process).
PMIX_MONITOR_APP_CONTROL "pmix.monitor.appctrl" (bool)
  The application desires to control the response to a monitoring event.
PMIX_MONITOR_HEARTBEAT "pmix.monitor.mbeat" (void)
  Register to have the PMIx server monitor the requestor for heartbeats.
PMIX_MONITOR_HEARTBEAT_TIME "pmix.monitor.btime" (uint32_t)
  Time in seconds before declaring heartbeat missed.
PMIX_MONITOR_HEARTBEAT_DROPS "pmix.monitor.bdrop" (uint32_t)
  Number of heartbeats that can be missed before generating the event.
PMIX_MONITOR_FILE "pmix.monitor.fmon" (char*)
  Register to monitor file for signs of life.
PMIX_MONITOR_FILE_SIZE "pmix.monitor.fsize" (bool)
  Monitor size of given file is growing to determine if the application is running.
PMIX_MONITOR_FILE_ACCESS "pmix.monitor.faccess" (char*)
Monitor time since last access of given file to determine if the application is running.

```c
PMIX_MONITOR_FILE_MODIFY  "pmix.monitor.fmod" (char*)
```

Monitor time since last modified of given file to determine if the application is running.

```c
PMIX_MONITOR_FILE_CHECK_TIME  "pmix.monitor.ftime" (uint32_t)
```

Time in seconds between checking the file.

```c
PMIX_MONITOR_FILE_DROPS  "pmix.monitor.fdrop" (uint32_t)
```

Number of file checks that can be missed before generating the event.

---

### Description

Request that application processes be monitored via several possible methods. For example, that the server monitor this process for periodic heartbeats as an indication that the process has not become “wedged”. When a monitor detects the specified alarm condition, it will generate an event notification using the provided error code and passing along any available relevant information. It is up to the caller to register a corresponding event handler.

The `monitor` argument is an attribute indicating the type of monitor being requested. For example, `PMIX_MONITOR_FILE` to indicate that the requestor is asking that a file be monitored.

The `error` argument is the status code to be used when generating an event notification alerting that the monitor has been triggered. The range of the notification defaults to `PMIX_RANGE_NAMESPACE`. This can be changed by providing a `PMIX_RANGE` directive.

The `directives` argument characterizes the monitoring request (e.g., monitor file size) and frequency of checking to be done.

The `cbfunc` function provides a `status` to indicate whether or not the request was granted, and to provide some information as to the reason for any denial in the `pmix_info_cbfunc_t` array of `pmix_info_t` structures.

---

#### 7.3.2 PMIx_Heartbeat

**Summary**

Send a heartbeat to the PMIx server library

**Format**

```c
PMIx v2.0
void PMIx_Heartbeat(void)
```
**Description**

A simplified macro wrapping `PMIx_Process_monitor_nb` that sends a heartbeat to the PMIx server library.

### 7.4 Logging

The logging interface supports posting information by applications and SMS elements to persistent storage. This function is not intended for output of computational results, but rather for reporting status and saving state information such as inserting computation progress reports into the application’s SMS job log or error reports to the local syslog.

#### 7.4.1 PMIx_Log_nb

**Summary**

Log data to a data service.

**Format**

```c
pmix_status_t
PMIx_Log_nb(const pmix_info_t data[], size_t ndata,
            const pmix_info_t directives[], size_t ndirs,
            pmix_op_cbfunc_t cbfunc, void *cbdata)
```

**IN data**

Array of info structures (array of handles)

**IN ndata**

Number of elements in the `data` array (`size_t`)

**IN directives**

Array of info structures (array of handles)

**IN ndirs**

Number of elements in the `directives` array (`size_t`)

**IN cbfunc**

Callback function `pmix_op_cbfunc_t` (function reference)

**IN cbdata**

Data to be passed to the callback function (memory reference)

Return codes are one of the following:
**PMIX_SUCCESS**  The logging request is valid and is being processed. The resulting status from the operation will be provided in the callback function.

**PMIX_ERR_BAD_PARAM**  The logging request contains at least one incorrect entry that prevents it from being processed. The callback function will *not* be called.

**PMIX_ERR_NOT_SUPPORTED**  The PMIx implementation does not support this function. The callback function will *not* be called.

---

### Required Attributes

If the PMIx library does not itself perform this operation, then it is required to pass any attributes provided by the client to the host environment for processing. In addition, it must include the following attributes in the passed *info* array:

- **PMIX_USERID**  "pmix.euid" (*uint32_t*)
  Effective user id.

- **PMIX_GRPID**  "pmix.egid" (*uint32_t*)
  Effective group id.

Host environments that implement support for this operation are required to support the following attributes:

- **PMIX_LOG_STDERR**  "pmix.log.stderr" (*char*)
  Log string to *stderr*.

- **PMIX_LOG_STDOUT**  "pmix.log.stdout" (*char*)
  Log string to *stdout*.

- **PMIX_LOG_SYSLOG**  "pmix.log.syslog" (*char*)
  Log data to syslog. Defaults to *ERROR* priority.

---

### Optional Attributes

The following attributes are optional for host environments that support this operation:

- **PMIX_LOG_MSG**  "pmix.log.msg" (*pmix_byte_object_t*)
  Message blob to be sent somewhere.

- **PMIX_LOG_EMAIL**  "pmix.log.email" (*pmix_data_array_t*)
  Log via email based on *pmix_info_t* containing directives.

- **PMIX_LOG_EMAIL_ADDR**  "pmix.log.emaddr" (*char*)
  Comma-delimited list of email addresses that are to receive the message.

- **PMIX_LOG_EMAIL_SUBJECT**  "pmix.log.emsubj" (*char*)
  Subject line for email.

- **PMIX_LOG_EMAIL_MSG**  "pmix.log.emmsg" (*char*)
  Message to be included in email.
**Description**

Log data subject to the services offered by the host environment. The data to be logged is provided in the `data` array. The (optional) `directives` can be used to direct the choice of logging channel. The callback function will be executed when the log operation has been completed. The `data` and `directives` arrays must be maintained until the callback is provided.

---

**Advice to users**

It is strongly recommended that the `PMIx_Log_nb` API not be used by applications for streaming data as it is not a “performant” transport and can perturb the application since it involves the local PMIx server and host SMS daemon.
This chapter defines the PMIx event notification system. These interfaces are designed to support
the reporting of events to/from clients and servers, and between library layers within a single
process.

8.1 Notification and Management

PMIx event notification provides an asynchronous out-of-band mechanism for communicating
events between application processes and/or elements of the SMS. Its uses span a wide range that
includes fault notification, coordination between multiple programming libraries within a single
process, and workflow orchestration for non-synchronous programming models. Events can be
divided into two distinct classes:

- **Job-specific events** directly relate to a job executing within the session, such as a debugger
  attachment, process failure within a related job, or events generated by an application process.
  Events in this category are to be immediately delivered to the PMIx server library for relay to the
  related local processes.

- **Environment events** indirectly relate to a job but do not specifically target the job itself. This
  category includes SMS-generated events such as Error Check and Correction (ECC) errors,
  temperature excursions, and other non-job conditions that might directly affect a session’s
  resources, but would never include an event generated by an application process. Note that
  although these do potentially impact the session’s jobs, they are not directly tied to those jobs.
  Thus, events in this category are to be delivered to the PMIx server library only upon request.

Both SMS elements and applications can register for events of either type.

**Advice to PMIx library implementers**

Race conditions can cause the registration to come after events of possible interest (e.g., a memory
ECC event that occurs after start of execution but prior to registration, or an application process
generating an event prior to another process registering to receive it). SMS vendors are requested to
cache environment events for some time to mitigate this situation, but are not required to do so.
However, PMIx implementers are required to cache all events received by the PMIx server library
and to deliver them to registering clients in the same order in which they were received.
Advice to users

Applications must be aware that they may not receive environment events that occur prior to registration, depending upon the capabilities of the host SMS.

The generator of an event can specify the target range for delivery of that event. Thus, the generator can choose to limit notification to processes on the local node, processes within the same job as the generator, processes within the same allocation, other threads within the same process, only the SMS (i.e., not to any application processes), all application processes, or to a custom range based on specific process identifiers. Only processes within the given range that register for the provided event code will be notified. In addition, the generator can use attributes to direct that the event not be delivered to any default event handlers, or to any multi-code handler (as defined below).

Event notifications provide the process identifier of the source of the event plus the event code and any additional information provided by the generator. When an event notification is received by a process, the registered handlers are scanned for their event code(s), with matching handlers assembled into an event chain for servicing. Note that users can also specify a source range when registering an event (using the same range designators described above) to further limit when they are to be invoked. When assembled, PMIx event chains are ordered based on both the specificity of the event handler and user directives at time of handler registration. By default, handlers are grouped into three categories based on the number of event codes that can trigger the callback:

- **single-code** handlers are serviced first as they are the most specific. These are handlers that are registered against one specific event code.

- **multi-code** handlers are serviced once all single-code handlers have completed. The handler will be included in the chain upon receipt of an event matching any of the provided codes.

- **default** handlers are serviced once all multi-code handlers have completed. These handlers are always included in the chain unless the generator specifically excludes them.

Users can specify the callback order of a handler within its category at the time of registration. Ordering can be specified either by providing the relevant returned event handler registration ID or using event handler names, if the user specified an event handler name when registering the corresponding event. Thus, users can specify that a given handler be executed before or after another handler should both handlers appear in an event chain (the ordering is ignored if the other handler isn’t included). Note that ordering does not imply immediate relationships. For example, multiple handlers registered to be serviced after event handler A will all be executed after A, but are not guaranteed to be executed in any particular order amongst themselves.

In addition, one event handler can be declared as the first handler to be executed in the chain. This handler will always be called prior to any other handler, regardless of category, provided the incoming event matches both the specified range and event code. Only one handler can be so designated — attempts to designate additional handlers as first will return an error. Deregistration of the declared first handler will re-open the position for subsequent assignment.
Similarly, one event handler can be declared as the last handler to be executed in the chain. This handler will always be called after all other handlers have executed, regardless of category, provided the incoming event matches both the specified range and event code. Note that this handler will not be called if the chain is terminated by an earlier handler. Only one handler can be designated as last — attempts to designate additional handlers as last will return an error. Deregistration of the declared last handler will re-open the position for subsequent assignment.

Advice to users

Note that the last handler is called after all registered default handlers that match the specified range of the incoming event unless a handler prior to it terminates the chain. Thus, if the application intends to define a last handler, it should ensure that no default handler aborts the process before it.

Upon completing its work and prior to returning, each handler must call the event handler completion function provided when it was invoked (including a status code plus any information to be passed to later handlers) so that the chain can continue being progressed. PMIx automatically aggregates the status and any results of each handler (as provided in the completion callback) with status from all prior handlers so that each step in the chain has full knowledge of what preceded it. An event handler can terminate all further progress along the chain by passing the \texttt{PMIX\_EVENT\_ACTION\_COMPLETE} status to the completion callback function.

8.1.1 PMIx\_Register\_event\_handler

Summary

Register an event handler

Format

\texttt{PMIx v2.0} \hspace{1cm} C

\begin{verbatim}
void
PMIx\_Register\_event\_handler(pmix\_status\_t codes[], size\_t ncodes,
                  pmix\_info\_t info[], size\_t ninfo,
                  pmix\_notification\_fn\_t evhdlr,
                  pmix\_evhdlr\_reg\_cbfunc\_t cbfunc,
                  void *cbdata);
\end{verbatim}
IN  codes
   Array of status codes (array of pmix_status_t)

IN  ncodes
   Number of elements in the codes array (size_t)

IN  info
   Array of info structures (array of handles)

IN  ninfo
   Number of elements in the info array (size_t)

IN  evhdlr
   Event handler to be called pmix_notification_fn_t (function reference)

IN  cbfunc
   Callback function pmix_evhdlr_reg_cbfunc_t (function reference)

IN  cbdata
   Data to be passed to the cbfunc callback function (memory reference)

\---------------------  Required Attributes  \---------------------

The following attributes are required to be supported by all PMIx libraries:

PMIX_EVENT_HDLR_NAME  "pmix.evname" (char*)
   String name identifying this handler.

PMIX_EVENT_HDLR_FIRST  "pmix.evfirst" (bool)
   Invoke this event handler before any other handlers.

PMIX_EVENT_HDLR_LAST   "pmix.evlast" (bool)
   Invoke this event handler after all other handlers have been called.

PMIX_EVENT_HDLR_FIRST_IN_CATEGORY  "pmix.evfirstcat" (bool)
   Invoke this event handler before any other handlers in this category.

PMIX_EVENT_HDLR_LAST_IN_CATEGORY  "pmix.evlastcat" (bool)
   Invoke this event handler after all other handlers in this category have been called.

PMIX_EVENT_HDLR_BEFORE  "pmix.evbefore" (char*)
   Put this event handler immediately before the one specified in the (char*) value.

PMIX_EVENT_HDLR_AFTER   "pmix.evafter" (char*)
   Put this event handler immediately after the one specified in the (char*) value.

PMIX_EVENT_HDLR_PREPEND  "pmix.evprepend" (bool)
   Prepend this handler to the precedence list within its category.

PMIX_EVENT_HDLR_APPEND   "pmix.evappend" (bool)
   Append this handler to the precedence list within its category.

PMIX_EVENT_CUSTOM_RANGE  "pmix.evrange" (pmix_data_array_t*)
Array of `pmix_proc_t` defining range of event notification.

```
PMIX_RANGE "pmix.range" (pmix_data_range_t)
```

Value for calls to publish/lookup/unpublish or for monitoring event notifications.

```
PMIX_EVENT_RETURN_OBJECT "pmix.evobject" (void *)
```

Object to be returned whenever the registered callback function `cbfunc` is invoked. The object will *only* be returned to the process that registered it.

Host environments that implement support for PMIx event notification are required to support the following attributes:

```
PMIX_EVENT_AFFECTED_PROC "pmix.evproc" (pmix_proc_t)
```

The single process that was affected.

```
PMIX_EVENT_AFFECTED_PROCS "pmix.evaaffected" (pmix_data_array_t*)
```

Array of `pmix_proc_t` defining affected processes.

Optional Attributes

Host environments that support PMIx event notification *may* offer notifications for environmental events impacting the job and for SMS events relating to the job. The following attributes are optional for host environments that support this operation:

```
PMIX_EVENT_TERMINATE_SESSION "pmix.evterm.sess" (bool)
```

The RM intends to terminate this session.

```
PMIX_EVENT_TERMINATE_JOB "pmix.evterm.job" (bool)
```

The RM intends to terminate this job.

```
PMIX_EVENT_TERMINATE_NODE "pmix.evterm.node" (bool)
```

The RM intends to terminate all processes on this node.

```
PMIX_EVENT_TERMINATE_PROC "pmix.evterm.proc" (bool)
```

The RM intends to terminate just this process.

```
PMIX_EVENT_ACTION_TIMEOUT "pmix.evtimeout" (int)
```

The time in seconds before the RM will execute error response.

```
PMIX_EVENT_SILENT_TERMINATION "pmix.evsilentterm" (bool)
```

Do not generate an event when this job normally terminates.
Description

Register an event handler to report events. Note that the codes being registered do not need to be PMIx error constants — any integer value can be registered. This allows for registration of non-PMIx events such as those defined by a particular SMS vendor or by an application itself.

Advice to users

In order to avoid potential conflicts, users are advised to only define codes that lie outside the range of the PMIx standard’s error codes. Thus, SMS vendors and application developers should constrain their definitions to positive values or negative values beyond the `PMIX_EXTERNAL_ERR_BASE` boundary.

Upon completion, the callback will receive a status based on the following table:

- **PMIX_SUCCESS** The event handler was successfully registered - the event handler identifier is returned in the callback.
- **PMIX_ERR_BAD_PARAM** One or more of the directives provided in the `info` array was unrecognized.
- **PMIX_ERR_NOT_SUPPORTED** The PMIx implementation does not support event notification, or the host SMS does not support notification of the specified event code.

Advice to users

As previously stated, upon completing its work, and prior to returning, each handler must call the event handler completion function provided when it was invoked (including a status code plus any information to be passed to later handlers) so that the chain can continue being progressed. An event handler can terminate all further progress along the chain by passing the `PMIX_EVENT_ACTION_COMPLETE` status to the completion callback function. Note that the parameters passed to the event handler (e.g., the `info` and `results` arrays) will cease to be valid once the completion function has been called - thus, any information in the incoming parameters that will be referenced following the call to the completion function must be copied.

8.1.2 PMIx_Deregister_event_handler

Summary

Deregister an event handler.
Format

```
PMIx v2.0

void PMIx_Deregister_event_handler(size_t evhdlr_ref, pmix_op_cbfunc_t cbfunc, void *cbdata);
```

IN `evhdlr_ref`
Event handler ID returned by registration (`size_t`)

IN `cbfunc`
Callback function to be executed upon completion of operation `pmix_op_cbfunc_t`
(function reference)

IN `cbdata`
Data to be passed to the `cbfunc` callback function (memory reference)

Description

Deregister an event handler. If non-NULL, the provided `cbfunc` will be called to confirm removal of the designated handler, including a status code as per the following:

- `PMIX_SUCCESS` The event handler was successfully deregistered.
- `PMIX_ERR_BAD_PARAM` The provided `evhdlr_ref` was unrecognized.
- `PMIX_ERR_NOT_SUPPORTED` The PMIx implementation does not support event notification.

8.1.3 PMIx_Notify_event

Summary

Report an event for notification via any registered event handler.

Format

```
PMIx v2.0

pmix_status_t PMIx_Notify_event(pmix_status_t status,
                                const pmix_proc_t *source,
                                pmix_data_range_t range,
                                pmix_info_t info[], size_t ninfo,
                                pmix_op_cbfunc_t cbfunc, void *cbdata);
```
### Required Attributes

The following attributes are required to be supported by all PMIx libraries:

- **PMIX_EVENT_NON_DEFAULT** "pmix.evnondef" (bool)
  - Event is not to be delivered to default event handlers.

- **PMIX_EVENT_CUSTOM_RANGE** "pmix.evrange" (pmix_data_array_t*)
  - Array of pmix_proc_t defining range of event notification.

Host environments that implement support for PMIx event notification are required to provide the following attributes for all events generated by the environment:

- **PMIX_EVENT_AFFECTED_PROC** "pmix.evproc" (pmix_proc_t)
  - The single process that was affected.

- **PMIX_EVENT_AFFECTED_PROCS** "pmix.evaffected" (pmix_data_array_t*)
  - Array of pmix_proc_t defining affected processes.
Description

Report an event for notification via any registered event handler. This function can be called by any PMIx process, including application processes, PMIx servers, and SMS elements. The PMIx server calls this API to report events it detected itself so that the host SMS daemon distribute and handle them, and to pass events given to it by its host down to any attached client processes for processing. Examples might include notification of the failure of another process, detection of an impending node failure due to rising temperatures, or an intent to preempt the application. Events may be locally generated or come from anywhere in the system.

Host SMS daemons call the API to pass events down to its embedded PMIx server both for transmittal to local client processes and for the server’s own internal processing.

Client application processes can call this function to notify the SMS and/or other application processes of an event it encountered. Note that processes are not constrained to report status values defined in the official PMIx standard — any integer value can be used. Thus, applications are free to define their own internal events and use the notification system for their own internal purposes.

Advice to users

The callback function will be called upon completion of the notify_event function’s actions. At that time, any messages required for executing the operation (e.g., to send the notification to the local PMIx server) will have been queued, but may not yet have been transmitted. The caller is required to maintain the input data until the callback function has been executed — the sole purpose of the callback function is to indicate when the input data is no longer required.
CHAPTER 9

Data Packing and Unpacking

PMIx intentionally does not include support for internode communications in the standard, instead relying on its host SMS environment to transfer any needed data and/or requests between nodes. These operations frequently involve PMIx-defined public data structures that include binary data. Many HPC clusters are homogeneous, and so transferring the structures can be done rather simply. However, greater effort is required in heterogeneous environments to ensure binary data is correctly transferred. PMIx buffer manipulation functions are provided for this purpose via standardized interfaces to ease adoption.

9.1 Support Macros

PMIx provides a set of convenience macros for creating, initiating, and releasing data buffers.

9.1.1 PMIX_DATA_BUFFER_CREATE

Summary

Allocate memory for a `pmix_data_buffer_t` object and initialize it

Format

```
Pmix v2.0
PMIx DATA_BUFFER_CREATE (buffer);
```

```
OUT buffer
```

Variable to be assigned the pointer to the allocated `pmix_data_buffer_t` (handle)

Description

This macro uses `calloc` to allocate memory for the buffer and initialize all fields in it
9.1.2 PMIX_DATA_BUFFERRELEASE

Summary
Free a `pmix_data_buffer_t` object and the data it contains

Format

```
PMIx v2.0
PMIX_DATA_BUFFER_RELEASE(buffer);
```

IN buffer
Pointer to the `pmix_data_buffer_t` to be released (handle)

Description
Free’s the data contained in the buffer, and then free’s the buffer itself

9.1.3 PMIX_DATA_BUFFER_CONSTRUCT

Summary
Initialize a statically declared `pmix_data_buffer_t` object

Format

```
PMIx v2.0
PMIX_DATA_BUFFER_CONSTRUCT(buffer);
```

IN buffer
Pointer to the allocated `pmix_data_buffer_t` that is to be initialized (handle)

Description
Initialize a pre-allocated buffer object

9.1.4 PMIX_DATA_BUFFER_DESTRUCT

Summary
Release the data contained in a `pmix_data_buffer_t` object
Format

PMIx v2.0

PMIX_DATA_BUFFER_DESTRUCT(buffer);

IN buffer
    Pointer to the pmix_data_buffer_t whose data is to be released (handle)

Description
Free’s the data contained in a pmix_data_buffer_t object

9.1.5 PMIXDATABUFFER_LOAD

Summary
Load a blob into a pmix_data_buffer_t object

Format

PMIx v2.0

PMIX_DATA_BUFFER_LOAD(buffer, data, size);

IN buffer
    Pointer to a pre-allocated pmix_data_buffer_t (handle)
IN data
    Pointer to a blob (char*)
IN size
    Number of bytes in the blob size_t

Description
Load the given data into the provided pmix_data_buffer_t object, usually done in
preparation for unpacking the provided data. Note that the data is not copied into the buffer - thus,
the blob must not be released until after operations on the buffer have completed.

9.1.6 PMIXDATABUFFER_UNLOAD

Summary
Unload the data from a pmix_data_buffer_t object
```
PMIx v2.0

PMIX_DATA_BUFFER_UNLOAD(buffer, data, size);
```

**IN buffer**
- Pointer to the `pmix_data_buffer_t` whose data is to be extracted (handle)

**OUT data**
- Variable to be assigned the pointer to the extracted blob (`void*`)

**OUT size**
- Variable to be assigned the number of bytes in the blob `size_t`

**Description**

Extract the data in a buffer, assigning the pointer to the data (and the number of bytes in the blob) to the provided variables, usually done to transmit the blob to a remote process for unpacking. The buffer’s internal pointer will be set to NULL to protect the data upon buffer destruct or release - thus, the user is responsible for releasing the blob when done with it.

## 9.2 General Routines

The following routines are provided to support internode transfers in heterogeneous environments.

### 9.2.1 PMIx_Data_pack

**Summary**

Pack one or more values of a specified type into a buffer, usually for transmission to another process

**Format**

```
PMIx v2.0

pmix_status_t
PMIx_Data_pack(const pmix_proc_t *target,
               pmix_data_buffer_t *buffer,
               void *src, int32_t num_vals,
               pmix_data_type_t type);
```
IN target
Pointer to a pmix_proc_t containing the nspace/rank of the process that will be
unpacking the final buffer. A NULL value may be used to indicate that the target is based on
the same PMIx version as the caller. Note that only the target’s nspace is relevant. (handle)

IN buffer
Pointer to a pmix_data_buffer_t where the packed data is to be stored (handle)

IN src
Pointer to a location where the data resides. Strings are to be passed as (char **) — i.e., the
caller must pass the address of the pointer to the string as the (void*). This allows the caller
to pass multiple strings in a single call. (memory reference)

IN num_vals
Number of elements pointed to by the src pointer. A string value is counted as a single value
regardless of length. The values must be contiguous in memory. Arrays of pointers (e.g.,
string arrays) should be contiguous, although the data pointed to need not be contiguous
across array entries. (int32_t)

IN type
The type of the data to be packed (pmix_data_type_t)

PMIX_SUCCESS The data has been packed as requested
PMIX_ERR_NOT_SUPPORTED The PMIx implementation does not support this function.
PMIX_ERR_BAD_PARAM The provided buffer or src is NULL
PMIX_ERR_UNKNOWN_DATA_TYPE The specified data type is not known to this
implementation
PMIX_ERR_OUT_OF_RESOURCE Not enough memory to support the operation
PMIX_ERROR General error

Description
The pack function packs one or more values of a specified type into the specified buffer. The buffer
must have already been initialized via the PMIX_DATA_BUFFER_CREATE or
PMIX_DATA_BUFFER_CONSTRUCT macros — otherwise, PMIx_Data_pack will return an
error. Providing an unsupported type flag will likewise be reported as an error.

Note that any data to be packed that is not hard type cast (i.e., not type cast to a specific size) may
lose precision when unpacked by a non-homogeneous recipient. The PMIx_Data_pack function
will do its best to deal with heterogeneity issues between the packer and unpacker in such cases.
Sending a number larger than can be handled by the recipient will return an error code (generated
upon unpacking) — the error cannot be detected during packing.

The namespace of the intended recipient of the packed buffer (i.e., the process that will be
unpacking it) is used solely to resolve any data type differences between PMIx versions. The
recipient must, therefore, be known to the user prior to calling the pack function so that the PMIx
library is aware of the version the recipient is using. Note that all processes in a given namespace
are required to use the same PMIx version — thus, the caller must only know at least one process
from the target’s namespace.

9.2.2 PMIx_Data_unpack

Summary

Unpack values from a pmix_data_buffer_t

Format

PMIx v2.0

C

pmix_status_t

PMIx_Data_unpack(const pmix_proc_t *source,

       pmix_data_buffer_t *buffer, void *dest,

       int32_t *max_num_values,

       pmix_data_type_t type);

IN  source
    Pointer to a pmix_proc_t structure containing the nspace/rank of the process that packed
    the provided buffer. A NULL value may be used to indicate that the source is based on the
    same PMIx version as the caller. Note that only the source’s nspace is relevant. (handle)

IN  buffer
    A pointer to the buffer from which the value will be extracted. (handle)

INOUT  dest
    A pointer to the memory location into which the data is to be stored. Note that these values
    will be stored contiguously in memory. For strings, this pointer must be to (char**) to
    provide a means of supporting multiple string operations. The unpack function will allocate
    memory for each string in the array - the caller must only provide adequate memory for the
    array of pointers. (void*)

INOUT  max_num_values
    The number of values to be unpacked — upon completion, the parameter will be set to the
    actual number of values unpacked. In most cases, this should match the maximum number
    provided in the parameters — but in no case will it exceed the value of this parameter. Note
    that unpacking fewer values than are actually available will leave the buffer in an unpackable
    state — the function will return an error code to warn of this condition. (int32_t)

IN  type
    The type of the data to be unpacked — must be one of the PMIx defined data types (pmix_data_type_t)

PMIX_SUCCESS  The data has been unpacked as requested
**PMIX_ERR_NOT_SUPPORTED**  The PMIx implementation does not support this function.

**PMIX_ERR_BAD_PARAM**  The provided buffer or dest is **NULL**.

**PMIX_ERR_UNKNOWN_DATA_TYPE**  The specified data type is not known to this implementation.

**PMIX_ERR_OUT_OF_RESOURCE**  Not enough memory to support the operation.

**PMIX_ERROR**  General error.

---

**Description**

The unpack function unpacks the next value (or values) of a specified type from the given buffer. The buffer must have already been initialized via an **PMIX_DATA_BUFFER_CREATE** or **PMIX_DATA_BUFFER_CONSTRUCT** call (and assumedly filled with some data) — otherwise, the unpack_value function will return an error. Providing an unsupported type flag will likewise be reported as an error, as will specifying a data type that *does not* match the type of the next item in the buffer. An attempt to read beyond the end of the stored data held in the buffer will also return an error.

NOTE: it is possible for the buffer to be corrupted and that PMIx will *think* there is a proper variable type at the beginning of an unpack region — but that the value is bogus (e.g., just a byte field in a string array that so happens to have a value that matches the specified data type flag). Therefore, the data type error check is *not* completely safe.

Unpacking values is a "nondestructive" process — i.e., the values are not removed from the buffer. It is therefore possible for the caller to re-unpack a value from the same buffer by resetting the unpack_ptr.

Warning: The caller is responsible for providing adequate memory storage for the requested data. The user must provide a parameter indicating the maximum number of values that can be unpacked into the allocated memory. If more values exist in the buffer than can fit into the memory storage, then the function will unpack what it can fit into that location and return an error code indicating that the buffer was only partially unpacked.

Note that any data that was not hard type cast (i.e., not type cast to a specific size) when packed may lose precision when unpacked by a non-homogeneous recipient. PMIx will do its best to deal with heterogeneity issues between the packer and unpacker in such cases. Sending a number larger than can be handled by the recipient will return an error code generated upon unpacking — these errors cannot be detected during packing.

The namespace of the process that packed the buffer is used solely to resolve any data type differences between PMIx versions. The packer must, therefore, be known to the user prior to calling the pack function so that the PMIx library is aware of the version the packer is using. Note that all processes in a given namespace are *required* to use the same PMIx version — thus, the caller must only know at least one process from the packer’s namespace.
9.2.3 PMIx_Data_copy

Summary
Copy a data value from one location to another.

Format

```c
PMIx v2.0

pmix_status_t
PMIx_Data_copy(void **dest, void *src,
    pmix_data_type_t type);
```

IN dest
The address of a pointer into which the address of the resulting data is to be stored.

(IN void**) 

IN src
A pointer to the memory location from which the data is to be copied (handle)

IN type
The type of the data to be copied — must be one of the PMIx defined data types. (pmix_data_type_t)

PMIX_SUCCESS The data has been copied as requested
PMIX_ERR_NOT_SUPPORTED The PMIx implementation does not support this function.
PMIX_ERR_BAD_PARAM The provided src or dest is NULL
PMIX_ERR_UNKNOWN_DATA_TYPE The specified data type is not known to this implementation
PMIX_ERR_OUT_OF_RESOURCE Not enough memory to support the operation
PMIX_ERROR General error

Description
Since registered data types can be complex structures, the system needs some way to know how to
copy the data from one location to another (e.g., for storage in the registry). This function, which
can call other copy functions to build up complex data types, defines the method for making a copy
of the specified data type.

9.2.4 PMIx_Data_print

Summary
Pretty-print a data value.
```c
pmix_status_t PMIx_Data_print(char **output, char *prefix,
    void *src, pmix_data_type_t type);

IN output
    The address of a pointer into which the address of the resulting output is to be stored.
    (char**) IN prefix
    String to be prepended to the resulting output (char*)
IN src
    A pointer to the memory location of the data value to be printed (handle)
IN type
    The type of the data value to be printed — must be one of the PMIx defined data types. (pmix_data_type_t)

PMIX_SUCCESS The data has been printed as requested
PMIX_ERR_BAD_PARAM The provided data type is not recognized.
PMIX_ERR_NOT_SUPPORTED The PMIx implementation does not support this function.

Description
Since registered data types can be complex structures, the system needs some way to know how to
print them (i.e., convert them to a string representation). Primarily for debug purposes.

9.2.5 PMIx_Data_copy_payload

Summary
Copy a payload from one buffer to another

Format
```
IN dest
  Pointer to the destination pmix_data_buffer_t (handle)

IN src
  Pointer to the source pmix_data_buffer_t (handle)

PMIX_SUCCESS  The data has been copied as requested
PMIX_ERR_BAD_PARAM  The src and dest pmix_data_buffer_t types do not match
PMIX_ERR_NOT_SUPPORTED  The PMIx implementation does not support this function.

Description
This function will append a copy of the payload in one buffer into another buffer. Note that this is not a destructive procedure — the source buffer’s payload will remain intact, as will any pre-existing payload in the destination’s buffer. Only the unpacked portion of the source payload will be copied.
CHAPTER 10

Server-Specific Interfaces

The RM daemon that hosts the PMIx server library interacts with that library in two distinct
manners. First, PMIx provides a set of APIs by which the host can request specific services from its
library. This includes generating regular expressions, registering information to be passed to client
processes, and requesting information on behalf of a remote process. Note that the host always has
access to all PMIx client APIs - the functions listed below are in addition to those available to a
PMIx client.

Second, the host can provide a set of callback functions by which the PMIx server library can pass
requests upward for servicing by the host. These include notifications of client connection and
finalize, as well as requests by clients for information and/or services that the PMIx server library
does not itself provide.

10.1 Server Support Functions

The following APIs allow the RM daemon that hosts the PMIx server library to request specific
services from the PMIx library.

10.1.1 PMIx_generate_regex

Summary

Generate a regular expression representation of the input string.

Format

```
PMIx v1.0

pmix_status_t
PMIx_generate_regex(const char *input, char **regex)
```

IN  input
    String to process (string)

OUT  regex
    Regular expression representation of input (string)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.
Description

Given a comma-separated list of input values, generate a regular expression that can be passed down to the PMIx client for parsing. The caller is responsible for free’ing the resulting string.

If values have leading zero’s, then that is preserved, as are prefix and suffix strings. For example, an input string of “odin009.org,odin010.org,odin011.org,odin012.org,odin[102-107].org” will return a regular expression of “pmix:odin[009-012,102-107].org”

Advice to users

The returned regular expression will have a “pmix:” at the beginning of the string. This informs the PMIx parser that the string was produced using the PRI’s regular expression generator, and thus that same plugin should be used for parsing the string.

10.1.2 PMIx_generate_ppn

Summary

Generate a regular expression representation of the input string.

Format

PMIx v1.0

C

pmix_status_t PMIx_generate_ppn(const char *input, char **ppn)

IN input

String to process (string)

OUT regex

Regular expression representation of input (string)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.
Description

The input is expected to consist of a semicolon-separated list of ranges representing the ranks of processes on each node of the job. Thus, an input of "1-4;2-5;8,10,11,12;6,7,9" would generate a regex of "pmix:2x(3);8,10-12;6-7,9"

Advice to users

The returned regular expression will have a “pmix:” at the beginning of the string. This informs the PMIx parser that the string was produced using the PRI’s regular expression generator, and thus that same plugin should be used for parsing the string.

10.1.3 PMIx_server_register_nspace

Summary

Setup the data about a particular namespace.

Format

PMIx server_register_nspace

pmix_status_t
PMIx_server_register_nspace(const pmix_nspace_t nspace, int nlocalprocs, pmix_info_t info[], size_t ninfo, pmix_op_cbfunc_t cbfunc, void *cbdata)

IN nspace
    namespace (string)

IN nlocalprocs
    number of local processes (integer)

IN info
    Array of info structures (array of handles)

IN ninfo
    Number of elements in the info array (integer)

IN cbfunc
    Callback function pmix_op_cbfunc_t (function reference)

IN cbdata
    Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.
The following attributes are required to be supported by all PMIx libraries:

**PMIX_REGISTER_NODATA** "pmix.reg.nodata" (bool)

Registration is for this namespace only, do not copy job data.

Host environments are required to provide the following attributes:

- for the given namespace:
  - **PMIX_NSPACE** "pmix.nspace" (char*)
    Namespace of the job.
  - **PMIX_JOBID** "pmix.jobid" (char*)
    Job identifier assigned by the scheduler.
  - **PMIX_NODE_LIST** "pmix.nlist" (char*)
    Comma-delimited list of nodes running processes for this job.
  - **PMIX_UNIV_SIZE** "pmix.univ.size" (uint32_t)
    Number of processes in this namespace.
  - **PMIX_JOB_SIZE** "pmix.job.size" (uint32_t)
    Number of processes in this job.
  - **PMIX_MAX_PROCS** "pmix.max.size" (uint32_t)
    Maximum number of processes for this job.
  - **PMIX_NUM_NODES** "pmix.num.nodes" (uint32_t)
    Number of nodes in this namespace.
  - **PMIX_NODE_MAP** "pmix.nmap" (char*)
    Regular expression of nodes containing processes for this job.
  - **PMIX_PROC_MAP** "pmix.pmap" (char*)
    Regular expression describing processes on each node within this job.

- for its own node:
  - **PMIX_LOCAL_SIZE** "pmix.local.size" (uint32_t)
    Number of processes in this job on this node.
  - **PMIX_LOCAL_PEERS** "pmix.lpeers" (char*)
    Comma-delimited list of ranks on this node within the specified namespace.
  - **PMIX_LOCAL_CPUSETS** "pmix.lcpus" (char*)
    Colon-delimited cpusets of local peers within the specified namespace.

- for each process in the given namespace:
  - **PMIX_RANK** "pmix.rank" (pmix_rank_t)
Process rank within the job.

- **PMIX_LOCAL_RANK** "pmix.lrank" (uint16_t)
  Local rank on this node within this job.

- **PMIX_NODE_RANK** "pmix.nrank" (uint16_t)
  Process rank on this node spanning all jobs.

- **PMIX_NODEID** "pmix.nodeid" (uint32_t)
  Node identifier where the specified process is located, expressed as the node’s index (beginning at zero) in an array of nodes comprising the users allocation.

If more than one application is included in the namespace, then the host environment is also required to provide the following attributes:

- for each application:
  - **PMIX_APPNUM** "pmix.appnum" (uint32_t)
    Application number within the job.
  - **PMIX_APP_LDR** "pmix.aldr" (pmix_rank_t)
    Lowest rank in this application within this job.
  - **PMIX_APP_SIZE** "pmix.app.size" (uint32_t)
    Number of processes in this application.

- for each process:
  - **PMIX_APP_RANK** "pmix.apprank" (pmix_rank_t)
    Process rank within this application.

---

Optional Attributes

The following attributes may be provided by host environments:

- for the given namespace:
  - **PMIX_SERVER_NSNAME** "pmix.srv.nspace" (char*)
    Name of the namespace to use for this PMIx server.
  - **PMIX_SERVER_RANK** "pmix.srv.rank" (pmix_rank_t)
    Rank of this PMIx server.
  - **PMIX_NPROC_OFFSET** "pmix.offset" (pmix_rank_t)
    Starting global rank of this job.
  - **PMIX_APP_LDR** "pmix.aldr" (pmix_rank_t)
    Lowest rank in this application within this job.
  - **PMIX_SESSION_ID** "pmix.session.id" (uint32_t)
    Session identifier.
- `PMIX_ALLOCATED_NODELIST"pmix.alist" (char*)`
  Comma-delimited list of all nodes in this allocation regardless of whether or not they currently host processes.

- `PMIX_JOB_NUM_APPS  "pmix.job.napps" (uint32_t)`
  Number of applications in this job.

- `PMIX_MAPBY  "pmix.mapby" (char*)`
  Process mapping policy.

- `PMIX_RANKBY  "pmix.rankby" (char*)`
  Process ranking policy.

- `PMIX_BINDTO  "pmix.bindto" (char*)`
  Process binding policy.

- for each application in the given namespace:
  - `PMIX_APP_SIZE  "pmix.app.size" (uint32_t)`
    Number of processes in this application.

- for its own node:
  - `PMIX_AVAIL_PHYS_MEMORY  "pmix.pmem" (uint64_t)`
    Total available physical memory on this node.
  - `PMIX_HWLOC_XML_V1  "pmix.hwlocxml1" (char*)`
    XML representation of local topology using hwloc’s v1.x format.
  - `PMIX_HWLOC_XML_V2  "pmix.hwlocxml2" (char*)`
    XML representation of local topology using hwloc’s v2.x format.
  - `PMIX_LOCALLLDR  "pmix.lldr" (pmix_rank_t)`
    Lowest rank on this node within this job.
  - `PMIX_NODE_SIZE  "pmix.node.size" (uint32_t)`
    Number of processes across all jobs on this node.
  - `PMIX_LOCAL_PROCS  "pmix.lprocs" (pmix_proc_t array)`
    Array of `pmix_proc_t` of processes on the specified node.

- for each process in the given namespace:
  - `PMIX_PROCID  "pmix.procid" (pmix_proc_t)`
    Process identifier
  - `PMIX_GLOBAL_RANK  "pmix.grank" (pmix_rank_t)`
    Process rank spanning across all jobs in this session.
  - `PMIX_HOSTNAME  "pmix.hname" (char*)`
    Name of the host where the specified process is running.
Attributes not directly provided by the host environment may be derived by the PMIx server library from other required information and included in the data made available to the server library’s clients.

### Description

Pass job-related information to the PMIx server library for distribution to local client processes.

#### Advice to PMIx server hosts

Host environments are required to execute this operation prior to starting any local application process within the given namespace.

The PMIx server must register all namespaces that will participate in collective operations with local processes. This means that the server must register a namespace even if it will not host any local processes from within that namespace if any local process of another namespace might at some point perform an operation involving one or more processes from the new namespace. This is necessary so that the collective operation can identify the participants and know when it is locally complete.

The caller must also provide the number of local processes that will be launched within this namespace. This is required for the PMIx server library to correctly handle collectives as a collective operation call can occur before all the local processes have been started.

#### Advice to users

The number of local processes for any given namespace is generally fixed at the time of application launch. Calls to `PMIx_Spawn` result in processes launched in their own namespace, not that of their parent. However, it is possible for processes to migrate to another node via a call to `PMIx_Job_control_nb`, thus resulting in a change to the number of local processes on both the initial node and the node to which the process moved. It is therefore critical that applications not migrate processes without first ensuring that PMIx-based collective operations are not in progress, and that no such operations be initiated until process migration has completed.

### 10.1.4 PMIx_server_deregister_nspace

#### Summary

Deregister a namespace.
void PMIx_server_deregister_nspace(const pmix_nspace_t nspace,  
    pmix_op_cbfunc_t cbfunc, void *cbdata)

IN   nspace
    Namespace (string)

IN   cbfunc
    Callback function pmix_op_cbfunc_t (function reference)

IN   cbdata
    Data to be passed to the callback function (memory reference)

Description
Deregister the specified namespace and purge all objects relating to it, including any client information from that namespace. This is intended to support persistent PMIx servers by providing an opportunity for the host RM to tell the PMIx server library to release all memory for a completed job.

10.1.5 PMIx_server_register_client

Summary
Register a client process with the PMIx server library.

pmix_status_t
PMIx_server_register_client(const pmix_proc_t *proc,  
    uid_t uid, gid_t gid,  
    void *server_object,  
    pmix_op_cbfunc_t cbfunc, void *cbdata)
Advice to PMIx server hosts

Host environments are **required** to execute this operation prior to starting the client process. The expected user ID and group ID of the child process helps the server library to properly authenticate clients as they connect by requiring the two values to match.

The host server can also, if it desires, provide an object it wishes to be returned when a server function is called that relates to a specific process. For example, the host server may have an object that tracks the specific client. Passing the object to the library allows the library to provide that object to the host server during subsequent calls related to that client, such as a `pmix_server_client_connected_fn_t` function. This allows the host server to access the object without performing a lookup based on the client’s namespace and rank.

### 10.1.6 PMIx_server_deregister_client

**Summary**

Deregister a client and purge all data relating to it.

**Format**

```c
void
PMIx_server_deregister_client(const pmix_proc_t *proc,
                               pmix_op_cbfunc_t cbfunc, void *cbdata)
```

| IN  | proc                      | `pmix_proc_t` structure (handle) |
| IN  | cbfunc                    | Callback function `pmix_op_cbfunc_t` (function reference) |
| IN  | cbdata                    | Data to be passed to the callback function (memory reference) |
Description

The `PMIx_server_deregister_nspace` API will delete all client information for that namespace. The PMIx server library will automatically perform that operation upon disconnect of all local clients. This API is therefore intended primarily for use in exception cases, but can be called in non-exception cases if desired.

10.1.7 `PMIx_server_setup_fork`

Summary

Setup the environment of a child process to be forked by the host.

Format

```c
pmix_status_t
PMIx_server_setup_fork(const pmix_proc_t *proc,
                        char ***env)
```

IN `proc`
    `pmix_proc_t` structure (handle)

IN `env`
    Environment array (array of strings)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

Description

Setup the environment of a child process to be forked by the host so it can correctly interact with the PMIx server.

Advice to PMIx server hosts

Host environments are required to execute this operation prior to starting the client process.

The PMIx client needs some setup information so it can properly connect back to the server. This function will set appropriate environmental variables for this purpose, and will also provide any environmental variables that were specified in the launch command (e.g., via `PMIx_Spawn`) plus other values (e.g., variables required to properly initialize the client’s fabric library).
10.1.8 PMIx_server_dmodex_request

Summary

Define a function by which the host server can request modex data from the local PMIx server.

Format

```
PMIx v1.0

#include <pmix/rpc.h>

pmix_status_t PMIx_server_dmodex_request(const pmix_proc_t *proc,
                                         pmix_dmodex_response_fn_t cbfunc,
                                         void *cbdata)
```

- **IN proc**
  - `pmix_proc_t` structure (handle)
- **IN cbfunc**
  - Callback function `pmix_dmodex_response_fn_t` (function reference)
- **IN cbdata**
  - Data to be passed to the callback function (memory reference)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

Description

Define a function by which the host server can request modex data from the local PMIx server. Traditional wireup procedures revolve around the per-process posting of data (e.g., location and endpoint information) via the `PMIx_Put` and `PMIx_Commit` functions followed by a `PMIx_Fence` barrier that globally exchanges the posted information. However, the barrier operation represents a significant time impact at large scale.

PMIx supports an alternative wireup method known as **Direct Modex** that replaces the barrier-based exchange of all process-posted information with on-demand fetch of a peer’s data. In place of the barrier operation, data posted by each process is cached on the local PMIx server. When a process requests the information posted by a particular peer, it first checks the local cache to see if the data is already available. If not, then the request is passed to the local PMIx server, which subsequently requests that its RM host request the data from the RM daemon on the node where the specified peer process is located. Upon receiving the request, the RM daemon passes the request into its PMIx server library using the `PMIx_server_dmodex_request` function, receiving the response in the provided `cbfunc` once the indicated process has posted its information. The RM daemon then returns the data to the requesting daemon, who subsequently passes the data to its PMIx server library for transfer to the requesting client.
Advice to users

While direct modex allows for faster launch times by eliminating the barrier operation, per-peer retrieval of posted information is less efficient. Optimizations can be implemented - e.g., by returning posted information from all processes on a node upon first request - but in general direct modex remains best suited for sparsely connected applications.

10.1.9 PMIx_server_setup_application

Summary

Provide a function by which the resource manager can request application-specific setup data prior to launch of an application.

Format

PMIx v2.0

```c
pmix_status_t
PMIx_server_setup_application(const pmix_nspace_t nspace,
    pmix_info_t info[], size_t ninfo,
    pmix_setup_application_cbfunc_t cbfunc,
    void *cbdata)
```

- **IN nspace**
  namespace (string)
- **IN info**
  Array of info structures (array of handles)
- **IN ninfo**
  Number of elements in the info array (integer)
- **IN cbfunc**
  Callback function `pmix_setup_application_cbfunc_t` (function reference)
- **IN cbdata**
  Data to be passed to the cbfunc callback function (memory reference)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.
**Description**

Provide a function by which the RM can request application-specific setup data (e.g., environmental variables, fabric configuration and security credentials) from supporting PMIx server library subsystems prior to initiating launch of an application.

--- Advice to PMIx server hosts ---

Host environments are *required* to execute this operation prior to launching an application.

This is defined as a non-blocking operation in case contributing subsystems need to perform some potentially time consuming action (e.g., query a remote service) before responding. The returned data must be distributed by the RM and subsequently delivered to the local PMIx server on each node where application processes will execute prior to initiating execution of those processes.

In the callback function, the returned *info* array is owned by the PMIx server library and will be free’d when the provided *cbfunc* is called.

--- Advice to PMIx library implementers ---

Support for harvesting of environmental variables and providing of local configuration information by the PMIx implementation is optional.

---

**10.1.10  PMIx_server_setup_local_support**

**Summary**

Provide a function by which the local PMIx server can perform any application-specific operations prior to spawning local clients of a given application.
Format

```c
PMIx server_setup_local_support(const pmix_nspace_t nspace,
    pmix_info_t info[], size_t ninfo,
    pmix_op_cbfunc_t cbfunc,
    void *cbdata);
```

IN  `nspace`
    Namespace (string)

IN  `info`
    Array of info structures (array of handles)

IN  `ninfo`
    Number of elements in the `info` array (integer)

IN  `cbfunc`
    Callback function `pmix_op_cbfunc_t` (function reference)

IN  `cbdata`
    Data to be passed to the callback function (memory reference)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

Description

Provide a function by which the local PMIx server can perform any application-specific operations prior to spawning local clients of a given application. For example, a network library might need to setup the local driver for “instant on” addressing. The data provided in the `info` array is the data provided to there host RM from the a call to `PMIx_server_setup_application`.

Advice to PMIx server hosts

Host environments are required to execute this operation prior to starting any local application processes from the specified namespace.
PMIx utilizes a "function-shipping" approach to support for implementing the server-side of the protocol. This method allows RMs to implement the server without being burdened with PMIx internal details. When a request is received from the client, the corresponding server function will be called with the information.

Any functions not supported by the RM can be indicated by a NULL for the function pointer. Client calls to such functions will return a PMIX_ERR_NOT_SUPPORTED status.

The host RM will provide the function pointers in a pmix_server_module_t structure passed to PMIx_server_init. That module structure and associated function references are defined in this section.

**Advice to PMIx server hosts**

For performance purposes, the host server is required to return as quickly as possible from all functions. Execution of the function is thus to be done asynchronously so as to allow the PMIx server support library to handle multiple client requests as quickly and scalably as possible.

All data passed to the host server functions is “owned” by the PMIX server support library and MUST NOT be free’d. Data returned by the host server via callback function is owned by the host server, which is free to release it upon return from the callback.

### 10.2.1 pmix_server_module_t Module

**Summary**

List of function pointers that a PMIx server passes to PMIx_server_init during startup.

**Format**
typedef struct pmix_server_module_2_0_0_t
    /* v1x interfaces */
    pmix_server_client_connected_fn_t client_connected;
    pmix_server_client_finalized_fn_t client_finalized;
    pmix_server_abort_fn_t abort;
    pmix_server_fencenb_fn_t fence_nb;
    pmix_server_dmodex_req_fn_t direct_modex;
    pmix_server_publish_fn_t publish;
    pmix_server_lookup_fn_t lookup;
    pmix_server_unpublish_fn_t unpublish;
    pmix_server_spawn_fn_t spawn;
    pmix_server_connect_fn_t connect;
    pmix_server_disconnect_fn_t disconnect;
    pmix_server_register_events_fn_t register_events;
    pmix_server_deregister_events_fn_t deregister_events;
    pmix_server_listener_fn_t listener;
    /* v2x interfaces */
    pmix_server_notify_event_fn_t notify_event;
    pmix_server_query_fn_t query;
    pmix_server_tool_connection_fn_t tool_connected;
    pmix_server_log_fn_t log;
    pmix_server_alloc_fn_t allocate;
    pmix_server_job_control_fn_t job_control;
    pmix_server_monitor_fn_t monitor;

10.2.2 pmix_server_client_connected_fn_t

Summary

Notify the host server that a client connected to this server.

Format

PMIx v1.0

typedef pmix_status_t (*pmix_server_client_connected_fn_t)(
    const pmix_proc_t *proc,
    void* server_object,
    pmix_op_cbfunc_t cbfunc,
    void *cbdata)
IN proc
    pmix_proc_t structure (handle)
IN server_object
    object reference (memory reference)
IN cbfunc
    Callback function pmix_op_cbfunc_t (function reference)
IN cbdata
    Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Description
Notify the host environment that a client has called PMIx_Init. Note that the client will be in a
blocked state until the host server executes the callback function, thus allowing the PMIx server
support library to release the client. The server_object parameter will be the value of the
server_object parameter passed to PMIx_server_register_client by the host server
when registering the connecting client. If provided, an implementation of
pmix_server_client_connected_fn_t is only required to call the callback function
designated. A host server can choose to not be notified when clients connect by setting
client_connected to NULL.

It is possible that only a subset of the clients in a namespace call PMIx_init. The server’s
pmix_server_client_connected_fn_t implementation should not depend on being
called once per rank in a namespace or delay calling the callback function until all ranks have
connected. However, if a rank makes any PMIx calls, it must first call PMIx_Init and therefore
the server’s mpix_server_client_connected_fn_t will be called before any other
server functions specific to the rank.

Advice to PMIx server hosts
This operation is an opportunity for a host environment to update the status of the ranks it manages.
It is also a convenient and well defined time to perform initialization necessary to support further
calls into the server related to that rank.

10.2.3 pmix_server_client_finalized_fn_t

Summary
Notify the host environment that a client called PMIx_Finalize.
Format

```c
typedef pmix_status_t (*pmix_server_client_finalized_fn_t)(
    const pmix_proc_t *proc,
    void* server_object,
    pmix_op_cbfunc_t cbfunc,
    void *cbdata)
```

**IN** `proc`
- `pmix_proc_t` structure (handle)

**IN** `server_object`
- Object reference (memory reference)

**IN** `cbfunc`
- Callback function `pmix_op_cbfunc_t` (function reference)

**IN** `cbdata`
- Data to be passed to the callback function (memory reference)

Returns **PMIX_SUCCESS** or a negative value corresponding to a PMIx error constant.

Description

Notify the host environment that a client called **PMIx_Finalize**. Note that the client will be in a blocked state until the host server executes the callback function, thus allowing the PMIx server support library to release the client. The server_object parameter will be the value of the server_object parameter passed to **PMIx_server_register_client** by the host server when registering the connecting client. If provided, an implementation of `pmix_server_client_finalized_fn_t` is only required to call the callback function designated. A host server can choose to not be notified when clients finalize by setting `client_finalized` to **NULL**.

Note that the host server is only being informed that the client has called **PMIx_Finalize**. The client might not have exited. If a client exits without calling **PMIx_Finalize**, the server support library will not call the `pmix_server_client_finalized_fn_t` implementation.

Advice to PMIx server hosts

This operation is an opportunity for a host server to update the status of the tasks it manages. It is also a convenient and well defined time to release resources used to support that client.
10.2.4  pmix_server_abort_fn_t

Summary

Notify the host environment that a local client called PMIx_Abort.

Format

```c
PMIx v1.0

typedef pmix_status_t (*pmix_server_abort_fn_t)(
    const pmix_proc_t *proc,
    void *server_object,
    int status,
    const char msg[],
    pmix_proc_t procs[],
    size_t nprocs,
    pmix_op_cbfunc_t cbfunc,
    void *cbdata)
```

IN  proc  pmix_proc_t  structure identifying the process requesting the abort (handle)
IN  server_object  object reference (memory reference)
IN  status  exit status (integer)
IN  msg  exit status message (string)
IN  procs  Array of pmix_proc_t structures identifying the processes to be terminated (array of handles)
IN  nprocs  Number of elements in the procs array (integer)
IN  cbfunc  Callback function pmix_op_cbfunc_t (function reference)
IN  cbdata  Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.
Description
A local client called PMIx_Abort. Note that the client will be in a blocked state until the host
server executes the callback function, thus allowing the PMIx server library to release the client.
The array of procs indicates which processes are to be terminated. A NULL indicates that all
processes in the client’s namespace are to be terminated.

10.2.5 pmix_server_fencenb_fn_t

Summary
At least one client called either PMIx_Fence or PMIx_Fence_nb.

Format

```
typedef pmix_status_t (*pmix_server_fencenb_fn_t)(
    const pmix_proc_t procs[],
    size_t nprocs,
    const pmix_info_t info[],
    size_t ninfo,
    char *data, size_t ndata,
    pmix_modex_cbfunc_t cbfunc,
    void *cbdata)
```

IN procs
Array of pmix_proc_t structures identifying operation participants(array of handles)
IN nprocs
Number of elements in the procs array (integer)
IN info
Array of info structures (array of handles)
IN ninfo
Number of elements in the info array (integer)
IN data
(string)
IN ndata
(integer)
IN cbfunc
Callback function pmix_modex_cbfunc_t (function reference)
IN cbdata
Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.
PMIx libraries are required to pass any provided attributes to the host environment for processing.

The following attributes are required to be supported by all host environments:

**Required Attributes**

- **PMIX_COLLECT_DATA** "pmix.collect" *(bool)*
  Collect data and return it at the end of the operation.

**Optional Attributes**

The following attributes are optional for host environments:

- **PMIX_TIMEOUT** "pmix.timeout" *(int)*
  Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

- **PMIX_COLLECTIVE_ALGO** "pmix.calgo" *(char*)*
  Comma-delimited list of algorithms to use for the collective operation.

- **PMIX_COLLECTIVE_ALGO_REQD** "pmix.calreqd" *(bool)*
  If true, indicates that the requested choice of algorithm is mandatory.

Advice to PMIx server hosts

Host environment are *required* to return **PMIX_ERR_NOT_SUPPORTED** if passed an attributed marked as **PMIX_INFO_REQD** that they do not support, even if support for that attribute is optional.
Description

All local clients in the provided array of procs called either PMIx_Fence or PMIx_Fence_nb. In either case, the host server will be called via a non-blocking function to execute the specified operation once all participating local processes have contributed. All processes in the specified procs array are required to participate in the PMIx_Fence / PMIx_Fence_nb operation. The callback is to be executed once every daemon hosting at least one participant has called the host server’s pmix_server_fencenb_fn_t function.

The provided data is to be collectively shared with all PMIx servers involved in the fence operation, and returned in the modex cbfunc. A NULL data value indicates that the local processes had no data to contribute.

The array of info structs is used to pass user-requested options to the server. This can include directives as to the algorithm to be used to execute the fence operation. The directives are optional unless the PMIX_INFO_REQD flag has been set - in such cases, the host RM is required to return an error if the directive cannot be met.

10.2.6 pmix_server_dmodex_req_fn_t

Summary

Used by the PMIx server to request its local host contact the PMIx server on the remote node that hosts the specified proc to obtain and return a direct modex blob for that proc.

Format

PMIx v1.0

```c
typedef pmix_status_t (*pmix_server_dmodex_req_fn_t)(
  const pmix_proc_t *proc,
  const pmix_info_t info[],
  size_t ninfo,
  pmix_modex_cbfunc_t cbfunc,
  void *cbdata)
```

IN proc
  pmix_proc_t structure identifying the process whose data is being requested (handle)

IN info
  Array of info structures (array of handles)

IN ninfo
  Number of elements in the info array (integer)

IN cbfunc
  Callback function pmix_modex_cbfunc_t (function reference)
IN cbdata
  Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are required to pass any provided attributes to the host environment for processing.

Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_TIMEOUT "pmix.timeout" (int)
  Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

Description

Used by the PMIx server to request its local host contact the PMIx server on the remote node that hosts the specified proc to obtain and return any information that process posted via calls to PMIx_Put and PMIx_Commit.

The array of info structs is used to pass user-requested options to the server. This can include a timeout to preclude an indefinite wait for data that may never become available. The directives are optional unless the mandatory flag has been set - in such cases, the host RM is required to return an error if the directive cannot be met.

10.2.7 pmix_server_publish_fn_t

Summary

Publish data per the PMIx API specification.
Format

```c
typedef pmix_status_t (*pmix_server_publish_fn_t)(
    const pmix_proc_t *proc,
    const pmix_info_t info[],
    size_t ninfo,
    pmix_op_cbfunc_t cbfunc,
    void *cbdata)
```

**IN**  
`proc`  
`pmix_proc_t` structure of the process publishing the data (handle)

**IN**  
`info`  
Array of info structures (array of handles)

**IN**  
`ninfo`  
Number of elements in the `info` array (integer)

**IN**  
`cbfunc`  
Callback function `pmix_op_cbfunc_t` (function reference)

**IN**  
`cbdata`  
Data to be passed to the callback function (memory reference)

Returns **PMIX_SUCCESS** or a negative value corresponding to a PMIx error constant.

---

**Required Attributes**

PMIx libraries are required to pass any provided attributes to the host environment for processing.

In addition, the following attributes are required to be included in the passed `info` array:

**PMIX_USERID**  
"pmix.euid" (uint32_t)  
Effective user id.

**PMIX_GRPID**  
"pmix.egid" (uint32_t)  
Effective group id.

Host environments that implement this entry point are required to support the following attributes:

**PMIX_RANGE**  
"pmix.range" (pmix_data_range_t)  
Value for calls to publish/lookup/unpublish or for monitoring event notifications.

**PMIX_PERSISTENCE**  
"pmix.persist" (pmix_persistence_t)  
Value for calls to **PMIx_Publish**.
Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_TIMEOUT  "pmix.timeout" (int)
   Time in seconds before the specified operation should time out (0 indicating infinite) in
   error. The timeout parameter can help avoid “ hangs” due to programming errors that prevent
   the target process from ever exposing its data.

Description

Publish data per the PMIx_Publish specification. The callback is to be executed upon
completion of the operation. The default data range is left to the host environment, but expected to
be PMIX_SESSION , and the default persistence PMIX_PERSIST_SESSION or their
equivalent. These values can be specified by including the respective attributed in the info array.

The persistence indicates how long the server should retain the data.

Advice to PMIx server hosts

The host environment is not required to guarantee support for any specific range - i.e., the
environment does not need to return an error if the data store doesn’t support a specified range so
long as it is covered by some internally defined range. However, the server must return an error (a)
if the key is duplicative within the storage range, and (b) if the server does not allow overwriting of
published info by the original publisher - it is left to the discretion of the host environment to allow
info-key-based flags to modify this behavior.

The PMIX_USERID and PMIX_GRPID of the publishing process will be provided to support
authorization-based access to published information and must be returned on any subsequent
lookup request.

10.2.8   pmix_server_lookup_fn_t

Summary

Lookup published data.
Format

PMIx v1.0

```
typedef pmix_status_t (*pmix_server_lookup_fn_t)(
    const pmix_proc_t *proc,
    char **keys,
    const pmix_info_t info[],
    size_t ninfo,
    pmix_lookup_cbfunc_t cbfunc,
    void *cbdata)
```

IN `proc`
    `pmix_proc_t` structure of the process seeking the data (handle)

IN `keys`
    (array of strings)

IN `info`
    Array of info structures (array of handles)

IN `ninfo`
    Number of elements in the `info` array (integer)

IN `cbfunc`
    Callback function `pmix_lookup_cbfunc_t` (function reference)

IN `cbdata`
    Data to be passed to the callback function (memory reference)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

---

Required Attributes

PMIx libraries are required to pass any provided attributes to the host environment for processing.

In addition, the following attributes are required to be included in the passed `info` array:

- **PMIX_USERID** "pmix.euid" (uint32_t)
  Effective user id.

- **PMIX_GRPID** "pmix.egid" (uint32_t)
  Effective group id.

Host environments that implement this entry point are required to support the following attributes:

- **PMIX_RANGE** "pmix.range" (pmix_data_range_t)
  Value for calls to publish/lookup/unpublish or for monitoring event notifications.

- **PMIX_WAIT** "pmix.wait" (int)
  Caller requests that the PMIx server wait until at least the specified number of values are found (0 indicates all and is the default).
Optional Attributes

The following attributes are optional for host environments that support this operation:

**PMIX_TIMEOUT**  "pmix.timeout" (int)

Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

---

Description

Lookup published data. The host server will be passed a **NULL**-terminated array of string keys identifying the data being requested.

The array of *info* structs is used to pass user-requested options to the server. The default data range is left to the host environment, but expected to be **PMIX_SESSION**. This can include a wait flag to indicate that the server should wait for all data to become available before executing the callback function, or should immediately callback with whatever data is available. In addition, a timeout can be specified on the wait to preclude an indefinite wait for data that may never be published.

---

Advice to PMIx server hosts

The **PMIX_USERID** and **PMIX_GRPID** of the requesting process will be provided to support authorization-based access to published information. The host environment is not required to guarantee support for any specific range - i.e., the environment does not need to return an error if the data store doesn’t support a specified range so long as it is covered by some internally defined range.

---

10.2.9 pmix_server_unpublish_fn_t

Summary

Delete data from the data store.
Format

```c
typedef pmix_status_t (*pmix_server_unpublish_fn_t)(
    const pmix_proc_t *proc,
    char **keys,
    const pmix_info_t info[],
    size_t ninfo,
    pmix_op_cbfunc_t cbfunc,
    void *cbdata)
```

**IN** proc
- pmix_proc_t structure identifying the process making the request (handle)

**IN** keys
- (array of strings)

**IN** info
- Array of info structures (array of handles)

**IN** ninfo
- Number of elements in the info array (integer)

**IN** cbfunc
- Callback function pmix_op_cbfunc_t (function reference)

**IN** cbdata
- Data to be passed to the callback function (memory reference)

Returns **PMIX_SUCCESS** or a negative value corresponding to a PMIx error constant.

---

### Required Attributes

PMIx libraries are required to pass any provided attributes to the host environment for processing. In addition, the following attributes are required to be included in the passed info array:

- **PMIX_USERID** "pmix.euid" (uint32_t)
  - Effective user id.

- **PMIX_GRPID** "pmix.egid" (uint32_t)
  - Effective group id.

Host environments that implement this entry point are required to support the following attributes:

- **PMIX_RANGE** "pmix.range" (pmix_data_range_t)
  - Value for calls to publish/lookup/unpublish or for monitoring event notifications.
Optional Attributes

The following attributes are optional for host environments that support this operation:

**PMIX_TIMEOUT**  "pmix.timeout"  (int)

Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

Description

Delete data from the data store. The host server will be passed a NULL-terminated array of string keys, plus potential directives such as the data range within which the keys should be deleted. The default data range is left to the host environment, but expected to be **PMIX_SESSION**. The callback is to be executed upon completion of the delete procedure.

Advice to PMIx server hosts

The **PMIX_USERID** and **PMIX_GRPID** of the requesting process will be provided to support authorization-based access to published information. The host environment is not required to guarantee support for any specific range - i.e., the environment does not need to return an error if the data store doesn’t support a specified range so long as it is covered by some internally defined range.

10.2.10  pmix_server_spawn_fn_t

Summary

Spawn a set of applications/processes as per the **PMIx_Spawn** API.
Format

PMIx 1.0

typedef pmix_status_t (*pmix_server_spawn_fn_t)(
    const pmix_proc_t *proc,
    const pmix_info_t job_info[],
    size_t ninfo,
    const pmix_app_t apps[],
    size_t napps,
    pmix_spawn_cbfunc_t cbfunc,
    void *cbdata)

IN  proc
    pmix_proc_t  structure of the process making the request (handle)
IN  job_info
    Array of info structures (array of handles)
IN  ninfo
    Number of elements in the jobinfo array (integer)
IN  apps
    Array of pmix_app_t  structures (array of handles)
IN  napps
    Number of elements in the apps array (integer)
IN  cbfunc
    Callback function pmix_spawn_cbfunc_t (function reference)
IN  cbdata
    Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are required to pass any provided attributes to the host environment for processing.
In addition, the following attributes are required to be included in the passed info array:

PMIX_USERID  "pmix.euid" (uint32_t)
    Effective user id.

PMIX_GRPID  "pmix.egid" (uint32_t)
    Effective group id.
Host environments that provide this module entry point are required to pass the `PMIX_SPAWNED` and `PMIX_PARENT_ID` attributes to all PMIx servers launching new child processes so those values can be returned to clients upon connection to the PMIx server. In addition, they are required to support the following attributes when present in either the `job_info` or the `info` array of an element of the `apps` array:

- **PMIX_WDIR** "pmix.wdir" (char*)
  Working directory for spawned processes.

- **PMIX_SET_SESSION_CWD** "pmix.ssncwd" (bool)
  Set the application’s current working directory to the session working directory assigned by the RM.

- **PMIX_PREFIX** "pmix.prefix" (char*)
  Prefix to use for starting spawned processes.

- **PMIX_HOST** "pmix.host" (char*)
  Comma-delimited list of hosts to use for spawned processes.

- **PMIX_HOSTFILE** "pmix.hostfile" (char*)
  Hostfile to use for spawned processes.

**Optional Attributes**

The following attributes are optional for host environments that support this operation:

- **PMIX_ADD_HOSTFILE** "pmix.addhostfile" (char*)
  Hostfile listing hosts to add to existing allocation.

- **PMIX_ADD_HOST** "pmix.addhost" (char*)
  Comma-delimited list of hosts to add to the allocation.

- **PMIX_PRELOAD_BIN** "pmixpreloadbin" (bool)
  Preload binaries onto nodes.

- **PMIX_PRELOAD_FILES** "pmix.preloadfiles" (char*)
  Comma-delimited list of files to pre-position on nodes.

- **PMIX_PERSONALITY** "pmix.pers" (char*)
  Name of personality to use.

- **PMIX_MAPPER** "pmix.mapper" (char*)
  Mapping mechanism to use for placing spawned processes.

- **PMIX_DISPLAY_MAP** "pmix.dispmap" (bool)
  Display process mapping upon spawn.

- **PMIX_PPR** "pmix.ppr" (char*)
  Number of processes to spawn on each identified resource.
PMIX_MAPBY  "pmix.mapby" (char*)
  Process mapping policy.

PMIX_RANKBY  "pmix.rankby" (char*)
  Process ranking policy.

PMIX_BINDTO  "pmix.bindto" (char*)
  Process binding policy.

PMIX_NON_PMI  "pmix.nopmi" (bool)
  Spawning processes will not call PMIx_Init.

PMIX_STDIN_TGT  "pmix.stdin" (uint32_t)
  Spawning process rank that is to receive stdin.

PMIX_FWD_STDIN  "pmix.fwd.stdin" (bool)
  Forward this process’s stdin to the designated process.

PMIX_FWD_STDOUT  "pmix.fwd.stdout" (bool)
  Forward stdout from spawned processes to this process.

PMIX_FWD_STDERR  "pmix.fwd.stderr" (bool)
  Forward stderr from spawned processes to this process.

PMIX_DEBUGGER_DAEMONS  "pmix.debugger" (bool)
  Spawning application consists of debugger daemons.

PMIX_TAG_OUTPUT  "pmix.tagout" (bool)
  Tag application output with the identity of the source process.

PMIX_TIMESTAMP_OUTPUT  "pmix.tsout" (bool)
  Timestamp output from applications.

PMIX_MERGE_STDERR_STDOUT  "pmix.mergeerrout" (bool)
  Merge stdout and stderr streams from application processes.

PMIX_OUTPUT_TO_FILE  "pmix.outfile" (char*)
  Output application output to the specified file.

PMIX_INDEX_ARGV  "pmix.indxargv" (bool)
  Mark the argv with the rank of the process.

PMIX_CPUS_PER_PROC  "pmix.cpuperproc" (uint32_t)
  Number of cpus to assign to each rank.

PMIX_NO_PROCS_ON_HEAD  "pmix.nolocal" (bool)
  Do not place processes on the head node.

PMIX_NO_OVERSUBSCRIBE  "pmix.noover" (bool)
  Do not oversubscribe the cpus.

PMIX_REPORT_BINDINGS  "pmix.repbind" (bool)
Report bindings of the individual processes.

PMIX_CPU_LIST "pmix.cpulist" (char*)
List of cpus to use for this job.

PMIX_JOB_RECOVERABLE "pmix.recover" (bool)
Application supports recoverable operations.

PMIX_JOB_CONTINUOUS "pmix.continuous" (bool)
Application is continuous, all failed processes should be immediately restarted.

PMIX_MAX_RESTARTS "pmix.maxrestarts" (uint32_t)
Maximum number of times to restart a job.

PMIX_TIMEOUT "pmix.timeout" (int)
Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

Description

Spawn a set of applications/processes as per the PMIx_Spawn API. Note that applications are not required to be MPI or any other programming model. Thus, the host server cannot make any assumptions as to their required support. The callback function is to be executed once all processes have been started. An error in starting any application or process in this request shall cause all applications and processes in the request to be terminated, and an error returned to the originating caller.

Note that a timeout can be specified in the job_info array to indicate that failure to start the requested job within the given time should result in termination to avoid hangs.

10.2.11 pmix_server_connect_fn_t

Summary

Record the specified processes as connected.
Format

typedef pmix_status_t (*pmix_server_connect_fn_t)(
    const pmix_proc_t procs[],
    size_t nprocs,
    const pmix_info_t info[],
    size_t ninfo,
    pmix_op_cbfunc_t cbfunc,
    void *cbdata)

IN procs
    Array of pmix_proc_t structures identifying participants (array of handles)
IN nprocs
    Number of elements in the procs array (integer)
IN info
    Array of info structures (array of handles)
IN ninfo
    Number of elements in the info array (integer)
IN cbfunc
    Callback function pmix_op_cbfunc_t (function reference)
IN cbdata
    Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are required to pass any provided attributes to the host environment for processing.

Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_TIMEOUT "pmix.timeout" (int)
    Time in seconds before the specified operation should time out (0 indicating infinite) in
    error. The timeout parameter can help avoid “hangs” due to programming errors that prevent
    the target process from ever exposing its data.

PMIX_COLLECTIVE_ALGO "pmix.calgo" (char*)
    Comma-delimited list of algorithms to use for the collective operation.

PMIX_COLLECTIVE_ALGO_REQD "pmix.calreqd" (bool)
    If true, indicates that the requested choice of algorithm is mandatory.
Description
Record the processes specified by the `procs` array as connected as per the PMIx definition. The callback is to be executed once every daemon hosting at least one participant has called the host server’s `pmix_server_connect_fn_t` function, and the host environment has completed any supporting operations required to meet the terms of the PMIx definition of connected processes.

Advice to PMIx server hosts
The PMIx server library will call this function once all local participants have called `PMIx_Connect` or its non-blocking form with the same array of participants.

10.2.12 `pmix_server_disconnect_fn_t`

Summary
Disconnect a previously connected set of processes.

Format

```c
typedef pmix_status_t (*pmix_server_disconnect_fn_t)(
    const pmix_proc_t procs[],
    size_t nprocs,
    const pmix_info_t info[],
    size_t ninfo,
    pmix_op_cbfunc_t cbfunc,
    void *cbdata)
```

**IN** `procs`
Array of `pmix_proc_t` structures identifying participants (array of handles)

**IN** `nprocs`
Number of elements in the `procs` array (integer)

**IN** `info`
Array of info structures (array of handles)

**IN** `ninfo`
Number of elements in the `info` array (integer)

**IN** `cbfunc`
Callback function `pmix_op_cbfunc_t` (function reference)

**IN** `cbdata`
Data to be passed to the callback function (memory reference)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.
Required Attributes

PMIx libraries are required to pass any provided attributes to the host environment for processing.

Optional Attributes

The following attributes are optional for host environments that support this operation:

`PMIX_TIMEOUT  "pmix.timeout" (int)`
Time in seconds before the specified operation should time out (0 indicating infinite) in error. The timeout parameter can help avoid “hangs” due to programming errors that prevent the target process from ever exposing its data.

Description

Disconnect a previously connected set of processes. The callback is to be executed once every daemon hosting at least one participant has called the host server’s has called the `pmix_server_disconnect_fn_t` function, and the host environment has completed any required supporting operations.

Advice to PMIx server hosts

A `PMIX_ERR_INVALID_OPERATION` error must be returned if the specified set of `procs` was not previously connected via a call to the `pmix_server_connect_fn_t` function. The PMIx server library will call this function once all local participants have called `PMIx_Disconnect` or its non-blocking form with the same array of participants.

10.2.13 `pmix_server_register_events_fn_t`

Summary

Register to receive notifications for the specified events.
typedef pmix_status_t (*pmix_server_register_events_fn_t)(
    pmix_status_t *codes,
    size_t ncodes,
    const pmix_info_t info[],
    size_t ninfo,
    pmix_op_cbfunc_t cbfunc,
    void *cbdata)

IN codes
    Array of pmix_status_t values (array of handles)

IN ncodes
    Number of elements in the codes array (integer)

IN info
    Array of info structures (array of handles)

IN ninfo
    Number of elements in the info array (integer)

IN cbfunc
    Callback function pmix_op_cbfunc_t (function reference)

IN cbdata
    Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are required to pass any provided attributes to the host environment for processing.
In addition, the following attributes are required to be included in the passed info array:

PMIX_USERID "pmix.euid" (uint32_t)
    Effective user id.

PMIX_GRPID "pmix.egid" (uint32_t)
    Effective group id.
Description

Register to receive notifications for the specified status codes. The *info* array included in this API is reserved for possible future directives to further steer notification.

--- Advice to PMIx library implementers ---

The PMIx server library must track all client registrations for subsequent notification. This module function shall only be called when:

- the client has requested notification of an environmental code (i.e., a PMIx code in the range between `PMIX_ERR_SYS_BASE` and `PMIX_ERR_SYS_OTHER`, inclusive) or a code that lies outside the defined PMIx range of constants; and

- the PMIx server library has not previously requested notification of that code - i.e., the host environment is to be contacted only once a given unique code value.

--- Advice to PMIx server hosts ---

The host environment is *required* to pass to its PMIx server library all non-environmental events that directly relate to a registered namespace without the PMIx server library explicitly requesting them. Environmental events are to be translated to their nearest PMIx equivalent code as defined in the range between `PMIX_ERR_SYS_BASE` and `PMIX_ERR_SYS_OTHER` (inclusive).

10.2.14 `pmix_server_deregister_events_fn_t`

Summary

Deregister to receive notifications for the specified events.
### Format

**C**

```c
typedef pmix_status_t (*pmix_server_deregister_events_fn_t)(
    pmix_status_t *codes,
    size_t ncodes,
    pmix_op_cbfunc_t cbfunc,
    void *cbdata)
```

### IN `codes`
Array of `pmix_status_t` values (array of handles)

### IN `ncodes`
Number of elements in the `codes` array (integer)

### IN `cbfunc`
Callback function `pmix_op_cbfunc_t` (function reference)

### IN `cbdata`
Data to be passed to the callback function (memory reference)

Returns **PMIX_SUCCESS** or a negative value corresponding to a PMIx error constant.

### Description

Deregister to receive notifications for the specified events to which the PMIx server has previously registered.

#### Advice to PMIx library implementers

The PMIx server library must track all client registrations. This module function shall only be called when:

- the library is deregistering environmental codes (i.e., a PMIx codes in the range between `PMIX_ERR_SYS_BASE` and `PMIX_ERR_SYS_OTHER`, inclusive) or codes that lies outside the defined PMIx range of constants; and
- no client (including the server library itself) remains registered for notifications on any included code - i.e., a code should be included in this call only when no registered notifications against it remain.

### Summary

**10.2.15 pmix_server_notify_event_fn_t**

**Summary**

Notify the specified processes of an event.
Format

PMIx v2.0

```c
typedef pmix_status_t (*pmix_server_notify_event_fn_t)(pmix_status_t code,
    const pmix_proc_t *source,
    pmix_data_range_t range,
    pmix_info_t info[],
    size_t ninfo,
    pmix_op_cbfunc_t cbfunc,
    void *cbdata);
```

IN  code
   The pmix_status_t event code being referenced structure (handle)

IN  source
   pmix_proc_t of process that generated the event (handle)

IN  range
   pmix_data_range_t range over which the event is to be distributed (handle)

IN  info
   Optional array of pmix_info_t structures containing additional information on the event
   (array of handles)

IN  ninfo
   Number of elements in the info array (integer)

IN  cbfunc
   Callback function pmix_op_cbfunc_t (function reference)

IN  cbdata
   Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are required to pass any provided attributes to the host environment for processing.

Host environments that provide this module entry point are required to support the following attributes:

```
PMIX_RANGE "pmix.range" (pmix_data_range_t)
```

Value for calls to publish/lookup/unpublish or for monitoring event notifications.
**Description**

Notify the specified processes (described through a combination of range and attributes provided in the info array) of an event generated either by the PMIx server itself or by one of its local clients. The process generating the event is provided in the source parameter, and any further descriptive information is included in the info array.

---

**Advice to PMIx server hosts**

The callback function is to be executed once the host environment no longer requires that the PMIx server library maintain the provided data structures. It does not necessarily indicate that the event has been delivered to any process, nor that the event has been distributed for delivery.

---

**10.2.16 pmix_server_listener_fn_t**

**Summary**

Register a socket the host server can monitor for connection requests.

**Format**

```c
typedef pmix_status_t (*pmix_server_listener_fn_t)(
    int listening_sd, 
    pmix_connection_cbfunc_t cbfunc, 
    void *cbdata)
```

- **IN incoming_sd** (integer)
- **IN cbfunc** Callback function `pmix_connection_cbfunc_t` (function reference)
- **IN cbdata** (memory reference)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant.

**Description**

Register a socket the host environment can monitor for connection requests, harvest them, and then call the PMIx server library’s internal callback function for further processing. A listener thread is essential to efficiently harvesting connection requests from large numbers of local clients such as occur when running on large SMPs. The host server listener is required to call accept on the incoming connection request, and then pass the resulting socket to the provided cbfunc. A `NULL` for this function will cause the internal PMIx server to spawn its own listener thread.
10.2.17  pmix_server_query_fn_t

Summary
Query information from the resource manager.

Format

PMIx v2.0

```c
typedef pmix_status_t (*pmix_server_query_fn_t)(
    pmix_proc_t *proct,
    pmix_query_t *queries, size_t nqueries,
    pmix_info_cbfunc_t cbfunc,
    void *cbdata)
```

- **IN proct**  
  `pmix_proc_t`  structure of the requesting process (handle)
- **IN queries**  
  Array of `pmix_query_t` structures (array of handles)
- **IN nqueries**  
  Number of elements in the `queries` array (integer)
- **IN cbfunc**  
  Callback function `pmix_info_cbfunc_t` (function reference)
- **IN cbdata**  
  Data to be passed to the callback function (memory reference)

Returns **PMIX_SUCCESS** or a negative value corresponding to a PMIx error constant.

Required Attributes

PMIx libraries are required to pass any provided attributes to the host environment for processing. In addition, the following attributes are required to be included in the passed `info` array:

- **PMIX_USERID**  
  "pmix.euid" (uint32_t)  
  Effective user id.
- **PMIX_GRPID**  
  "pmix.egid" (uint32_t)  
  Effective group id.
Optional Attributes

The following attributes are optional for host environments that support this operation:

**PMIX_QUERY_NAMESPACES**  "pmix.qry.ns" (char*)
Request a comma-delimited list of active namespaces.

**PMIX_QUERY_JOB_STATUS**  "pmix.qry.jst" (pmix_status_t)
Status of a specified, currently executing job.

**PMIX_QUERY_QUEUE_LIST**  "pmix.qry.qlst" (char*)
Request a comma-delimited list of scheduler queues.

**PMIX_QUERY_QUEUE_STATUS**  "pmix.qry.qst" (TBD)
Status of a specified scheduler queue.

**PMIX_QUERY_PROC_TABLE**  "pmix.qry.ptable" (char*)
Input namespace of the job whose information is being requested returns (pmix_data_array_t) an array of pmix_proc_info_t.

**PMIX_QUERY_LOCAL_PROC_TABLE**  "pmix.qry.lptable" (char*)
Input namespace of the job whose information is being requested returns (pmix_data_array_t) an array of pmix_proc_info_t for processes in job on same node.

**PMIX_QUERY_SPAWN_SUPPORT**  "pmix.qry.spawn" (bool)
Return a comma-delimited list of supported spawn attributes.

**PMIX_QUERY_DEBUG_SUPPORT**  "pmix.qry.debug" (bool)
Return a comma-delimited list of supported debug attributes.

**PMIX_QUERY_MEMORY_USAGE**  "pmix.qry.mem" (bool)
Return information on memory usage for the processes indicated in the qualifiers.

**PMIX_QUERY_LOCAL_ONLY**  "pmix.qry.local" (bool)
Constrain the query to local information only.

**PMIX_QUERY_REPORT_AVG**  "pmix.qry.avg" (bool)
Report average values.

**PMIX_QUERY_REPORT_MINMAX**  "pmix.qry.minmax" (bool)
Report minimum and maximum values.

**PMIX_QUERY_ALLOC_STATUS**  "pmix.query.alloc" (char*)
String identifier of the allocation whose status is being requested.

**PMIX_TIME_REMAINING**  "pmix.time.remaining" (char*)
Query number of seconds (uint32_t) remaining in allocation for the specified namespace.
Description

Query information from the host environment. The query will include the namespace/rank of the process that is requesting the info, an array of `pmix_query_t` describing the request, and a callback function/data for the return.

--- Advice to PMIx library implementers ---

The PMIx server library should not block in this function as the host environment may, depending upon the information being requested, require significant time to respond.

---

10.2.18 `pmix_server_tool_connection_fn_t`

Summary

Register that a tool has connected to the server.

Format

```c
typedef void (*pmix_server_tool_connection_fn_t)(
    pmix_info_t info[], size_t ninfo,
    pmix_tool_connection_cbfunc_t cbfunc,
    void *cbdata)
```

**IN** `info`
Array of `pmix_info_t` structures (array of handles)

**IN** `ninfo`
Number of elements in the `info` array (integer)

**IN** `cbfunc`
Callback function `pmix_tool_connection_cbfunc_t` (function reference)

**IN** `cbdata`
Data to be passed to the callback function (memory reference)

--- Required Attributes ---

PMIx libraries are required to pass the following attributes in the `info` array:

**PMIX_USERID** "pmix.euid" (uint32_t)
Effective user id.

**PMIX_GRPID** "pmix.egid" (uint32_t)
Effective group id.
Optional Attributes

The following attributes are optional for host environments that support this operation:

1. **PMIX_FWD_STDOUT** "pmix.fwd.stdout" (bool)
   Forward stdout from spawned processes to this process.

2. **PMIX_FWD_STDERR** "pmix.fwd.stderr" (bool)
   Forward stderr from spawned processes to this process.

3. **PMIX_FWD_STDIN** "pmix.fwd.stdin" (bool)
   Forward this process’s stdin to the designated process.

Description

Register that a tool has connected to the server, and request that the tool be assigned a namespace/rank identifier for further interactions. The `pmix_info_t` array is used to pass qualifiers for the connection request, including the effective uid and gid of the calling tool for authentication purposes.

Advice to PMIx server hosts

The host environment is solely responsible for authenticating and authorizing the connection, and for authorizing all subsequent tool requests.

10.2.19 `pmix_server_log_fn_t`

Summary

Log data on behalf of a client.
Format

PMIx v2.0

typedef void (*pmix_server_log_fn_t)(
    const pmix_proc_t *client,
    const pmix_info_t data[], size_t ndata,
    const pmix_info_t directives[], size_t ndirs,
    pmix_op_cbfunc_t cbfunc, void *cbdata)

IN  client
    pmix_proc_t structure (handle)

IN  data
    Array of info structures (array of handles)

IN  ndata
    Number of elements in the data array (integer)

IN  directives
    Array of info structures (array of handles)

IN  ndirs
    Number of elements in the directives array (integer)

IN  cbfunc
    Callback function pmix_op_cbfunc_t (function reference)

IN  cbdata
    Data to be passed to the callback function (memory reference)

Required Attributes

PMIx libraries are required to pass any provided attributes to the host environment for processing.
In addition, the following attributes are required to be included in the passed info array:

PMIX_USERID  "pmix.euid" (uint32_t)
    Effective user id.

PMIX_GRPID   "pmix.egid" (uint32_t)
    Effective group id.

Host environments that provide this module entry point are required to support the following attributes:

PMIX_LOG_STDERR  "pmix.log.stderr" (char*)
    Log string to stderr.

PMIX_LOG_STDOUT  "pmix.log.stdout" (char*)
    Log string to stdout.

PMIX_LOG_SYSLOG  "pmix.log.syslog" (char*)
    Log data to syslog. Defaults to ERROR priority.
Optional Attributes

The following attributes are optional for host environments that support this operation:

1. **PMIX_LOG_MSG**  "pmix.log.msg" (**pmix_byte_object_t**)  
   Message blob to be sent somewhere.

2. **PMIX_LOG_EMAIL**  "pmix.log.email" (**pmix_data_array_t**)  
   Log via email based on **pmix_info_t** containing directives.

3. **PMIX_LOG_EMAIL_ADDR**  "pmix.log.emaddr" (**char**)  
   Comma-delimited list of email addresses that are to receive the message.

4. **PMIX_LOG_EMAIL_SUBJECT**  "pmix.log.emsub" (**char**)  
   Subject line for email.

5. **PMIX_LOG_EMAIL_MSG**  "pmix.log.emmsg" (**char**)  
   Message to be included in email.

Description

Log data on behalf of a client. This function is not intended for output of computational results, but rather for reporting status and error messages.

10.2.20  **pmix_server_alloc_fn_t**

Summary

Request allocation operations on behalf of a client.
typedef pmix_status_t (*pmix_server_alloc_fn_t)(
    const pmix_proc_t *client,
    pmix_alloc_directive_t directive,
    const pmix_info_t data[], size_t ndata,
    pmix_info_cbfunc_t cbfunc, void *cbdata)

IN client
    pmix_proc_t structure of process making request (handle)

IN directive
    Specific action being requested (pmix_alloc_directive_t)

IN data
    Array of info structures (array of handles)

IN ndata
    Number of elements in the data array (integer)

IN cbfunc
    Callback function pmix_info_cbfunc_t (function reference)

IN cbdata
    Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

------------------ Required Attributes ------------------

PMIx libraries are required to pass any provided attributes to the host environment for processing.
In addition, the following attributes are required to be included in the passed info array:

PMIX_USERID "pmix.euid" (uint32_t)
    Effective user id.

PMIX_GRPID "pmix.egid" (uint32_t)
    Effective group id.

Host environments that provide this module entry point are required to support the following attributes:

PMIX_ALLOC_ID "pmix.alloc.id" (char*)
    Provide a string identifier for this allocation request which can later be used to query status of the request.

PMIX_ALLOC_NUM_NODES "pmix.alloc.nnodes" (uint64_t)
    The number of nodes.

PMIX_ALLOC_NUM_CPUS "pmix.alloc.ncpus" (uint64_t)
    Number of cpus.
PMIX_ALLOC_TIME  "pmix.alloc.time" (uint32_t)
   Time in seconds.

Optional Attributes

The following attributes are optional for host environments that support this operation:

PMIX_ALLOC_NODE_LIST  "pmix.alloc.nlist" (char*)
   Regular expression of the specific nodes.

PMIX_ALLOC_NUM_CPU_LIST  "pmix.alloc.ncpulist" (char*)
   Regular expression of the number of cpus for each node.

PMIX_ALLOC_CPU_LIST  "pmix.alloc.cpulist" (char*)
   Regular expression of the specific cpus indicating the cpus involved.

PMIX_ALLOC_MEM_SIZE  "pmix.alloc.msize" (float)
   Number of Megabytes.

PMIX_ALLOC_NETWORK  "pmix.alloc.net" (array)
   Array of pmix_info_t describing requested network resources. If not given as part of an
   pmix_info_t struct that identifies the involved nodes, then the description will be
   applied across all nodes in the requestor’s allocation.

PMIX_ALLOC_NETWORK_ID  "pmix.alloc.netid" (char*)
   Name of the network.

PMIX_ALLOC_BANDWIDTH  "pmix.alloc.bw" (float)
   Mbits/sec.

PMIX_ALLOC_NETWORK_QOS  "pmix.alloc.netqos" (char*)
   Quality of service level.
Description

Request new allocation or modifications to an existing allocation on behalf of a client. Several broad categories are envisioned, including the ability to:

- Request allocation of additional resources, including memory, bandwidth, and compute for an existing allocation. Any additional allocated resources will be considered as part of the current allocation, and thus will be released at the same time.
- Request a new allocation of resources. Note that the new allocation will be disjoint from (i.e., not affiliated with) the allocation of the requestor - thus the termination of one allocation will not impact the other.
- Extend the reservation on currently allocated resources, subject to scheduling availability and priorities.
- Return no-longer-required resources to the scheduler. This includes the loan of resources back to the scheduler with a promise to return them upon subsequent request.

The callback function provides a status to indicate whether or not the request was granted, and to provide some information as to the reason for any denial in the pmix_info_cbfunc_t array of pmix_info_t structures.

10.2.21 pmix_server_job_control_fn_t

Summary

Execute a job control action on behalf of a client.

Format

PMIx v2.0

```c
typedef pmix_status_t (*pmix_server_job_control_fn_t)(
    const pmix_proc_t *requestor,
    const pmix_proc_t targets[], size_t ntargets,
    const pmix_info_t directives[], size_t ndirs,
    pmix_info_cbfunc_t cbfunc, void *cbdata)
```

IN requestor
    pmix_proc_t structure of requesting process (handle)

IN targets
    Array of proc structures (array of handles)

IN ntargets
    Number of elements in the targets array (integer)

IN directives
    Array of info structures (array of handles)
IN ndirs
   Number of elements in the info array (integer)

IN cbfunc
   Callback function pmix_op_cbfunc_t (function reference)

IN cbdata
   Data to be passed to the callback function (memory reference)

Returns PMIX_SUCCESS or a negative value corresponding to a PMIx error constant.

-------------------- Required Attributes ---------------------

PMIx libraries are required to pass any provided attributes to the host environment for processing.
In addition, the following attributes are required to be included in the passed info array:

PMIX_USERID "pmix.euid" (uint32_t)
   Effective user id.

PMIX_GRPID "pmix.egid" (uint32_t)
   Effective group id.

Host environments that provide this module entry point are required to support the following attributes:

PMIX_JOB_CTRL_ID "pmix.jctrl.id" (char*)
   Provide a string identifier for this request.

PMIX_JOB_CTRL_PAUSE "pmix.jctrl.pause" (bool)
   Pause the specified processes.

PMIX_JOB_CTRL_RESUME "pmix.jctrl.resume" (bool)
   Resume (“un-pause”) the specified processes.

PMIX_JOB_CTRL_KILL "pmix.jctrl.kill" (bool)
   Forcibly terminate the specified processes and cleanup.

PMIX_JOB_CTRL_SIGNAL "pmix.jctrl.sig" (int)
   Send given signal to specified processes.

PMIX_JOB_CTRL_TERMINATE "pmix.jctrl.term" (bool)
   Politely terminate the specified processes.
Optional Attributes

The following attributes are optional for host environments that support this operation:

1. **PMIX_JOB_CTRL_CANCEL** "pmix.jctrl.cancel" (char*)
   Cancel the specified request (NULL implies cancel all requests from this requestor).

2. **PMIX_JOB_CTRL_RESTART** "pmix.jctrl.restart" (char*)
   Restart the specified processes using the given checkpoint ID.

3. **PMIX_JOB_CTRL_CHECKPOINT** "pmix.jctrl.ckpt" (char*)
   Checkpoint the specified processes and assign the given ID to it.

4. **PMIX_JOB_CTRL_CHECKPOINT_EVENT** "pmix.jctrl.ckptev" (bool)
   Use event notification to trigger a process checkpoint.

5. **PMIX_JOB_CTRL_CHECKPOINT_SIGNAL** "pmix.jctrl.ckptsig" (int)
   Use the given signal to trigger a process checkpoint.

6. **PMIX_JOB_CTRL_CHECKPOINT_TIMEOUT** "pmix.jctrl.ckptsig" (int)
   Time in seconds to wait for a checkpoint to complete.

7. **PMIX_JOB_CTRL_CHECKPOINT_METHOD** "pmix.jctrl.ckmethod" (pmix_data_array_t)
   Array of pmix_info_t declaring each method and value supported by this application.

8. **PMIX_JOB_CTRL_PROVISION** "pmix.jctrl.pvn" (char*)
   Regular expression identifying nodes that are to be provisioned.

9. **PMIX_JOB_CTRL_PROVISION_IMAGE** "pmix.jctrl.pvnimg" (char*)
   Name of the image that is to be provisioned.

10. **PMIX_JOB_CTRL_PREEMPTIBLE** "pmix.jctrl.preempt" (bool)
    Indicate that the job can be pre-empted.

---

**Description**

Execute a job control action on behalf of a client. The targets array identifies the processes to which the requested job control action is to be applied. A NULL value can be used to indicate all processes in the caller’s namespace. The use of PMIX_RANK_WILDARD can also be used to indicate that all processes in the given namespace are to be included.

The directives are provided as pmix_info_t structures in the directives array. The callback function provides a status to indicate whether or not the request was granted, and to provide some information as to the reason for any denial in the pmix_info_cbffunc_t array of pmix_info_t structures.
pmix_server_monitor_fn_t

Summary

Request that a client be monitored for activity.

Format

```c
/* Request that a client be monitored for activity */
typedef pmix_status_t (*pmix_server_monitor_fn_t)(
    const pmix_proc_t *requestor,
    const pmix_info_t *monitor, pmix_status_t error,
    const pmix_info_t directives[], size_t ndirs,
    pmix_info_cbfunc_t cbfunc, void *cbdata);
```

- **requestor**: `pmix_proc_t` structure of requesting process (handle)
- **monitor**: `pmix_info_t` identifying the type of monitor being requested (handle)
- **error**: Status code to use in generating event if alarm triggers (integer)
- **directives**: Array of info structures (array of handles)
- **ndirs**: Number of elements in the `info` array (integer)
- **cbfunc**: Callback function `pmix_op_cbfunc_t` (function reference)
- **cbdata**: Data to be passed to the callback function (memory reference)

Returns `PMIX_SUCCESS` or a negative value corresponding to a PMIx error constant. This entry point is only called for monitoring requests that are not directly supported by the PRI.

Required Attributes

If supported by the PMIx server library, then the library must not pass any supported attributes to the host environment. All attributes not directly supported by the server library must be passed to the host environment if it provides this module entry. In addition, the following attributes are required to be included in the passed `info` array:

- **PMIX_USERID** "pmix.euid" (uint32_t)
  - Effective user id.
- **PMIX_GRPID** "pmix.egid" (uint32_t)
Effective group id.

Host environments are not required to support any specific monitoring attributes.

--- Optional Attributes ---

The following attributes may be implemented by a host environment.

- **PMIX_MONITOR_ID** "pmix.monitor.id" (char*)
  Provide a string identifier for this request.

- **PMIX_MONITOR_CANCEL** "pmix.monitor.cancel" (char*)
  Identifier to be canceled (NULL means cancel all monitoring for this process).

- **PMIX_MONITOR_APP_CONTROL** "pmix.monitor.appctrl" (bool)
  The application desires to control the response to a monitoring event.

- **PMIX_MONITOR_HEARTBEAT** "pmix.monitor.mbeat" (void)
  Register to have the PMIx server monitor the requestor for heartbeats.

- **PMIX_MONITOR_HEARTBEAT_TIME** "pmix.monitor.btime" (uint32_t)
  Time in seconds before declaring heartbeat missed.

- **PMIX_MONITOR_HEARTBEAT_DROPS** "pmix.monitor.bdrop" (uint32_t)
  Number of heartbeats that can be missed before generating the event.

- **PMIX_MONITOR_FILE** "pmix.monitor.fmon" (char*)
  Register to monitor file for signs of life.

- **PMIX_MONITOR_FILE_SIZE** "pmix.monitor.fsize" (bool)
  Monitor size of given file is growing to determine if the application is running.

- **PMIX_MONITOR_FILE_ACCESS** "pmix.monitor.faccess" (char*)
  Monitor time since last access of given file to determine if the application is running.

- **PMIX_MONITOR_FILE_MODIFY** "pmix.monitor.fmod" (char*)
  Monitor time since last modified of given file to determine if the application is running.

- **PMIX_MONITOR_FILE_CHECK_TIME** "pmix.monitor.ftime" (uint32_t)
  Time in seconds between checking the file.

- **PMIX_MONITOR_FILE_DROPS** "pmix.monitor.fdrop" (uint32_t)
  Number of file checks that can be missed before generating the event.
Description

Request that a client be monitored for activity.

Advice to PMIx server hosts

If this module entry is provided and called by the PMIx server library, then the host environment must either provide the requested services or return `PMIX_ERR_NOT_SUPPORTED` to the provided `cbfunc`.
APPENDIX A

Acknowledgements

This document represents the work of many people who have contributed to the PMIx community. Without the hard work and dedication of these people this document would not have been possible. The sections below list some of the active participants and organizations in the various PMIx standard iterations.

A.1 Version 2.0

The following list includes some of the active participants in the PMIx v2 standardization process.

- Ralph H. Castain, Annapurna Dasari, Christopher A. Holguin, Andrew Friedley, Michael Klemm and Terry Wilmarth
- Joshua Hursey, David Solt, Alexander Eichenberger, Geoff Paulsen, and Sameh Sharkawi
- Aurelien Bouteiller and George Bosilca
- Artem Polyakov, Igor Ivanov and Boris Karasev
- Gilles Gouaillardet
- Michael A Raymond and Jim Stoffel
- Dirk Schubert
- Moe Jette
- Takahiro Kawashima and Shinji Sumimoto
- Howard Pritchard
- David Beer
- Brice Goglin
- Geoffroy Vallee, Swen Boehm, Thomas Naughton and David Bernholdt
- Adam Moody and Martin Schulz
- Ryan Grant and Stephen Olivier
- Michael Karo
The following institutions supported this effort through time and travel support for the people listed above.

• Intel Corporation
• IBM, Inc.
• University of Tennessee, Knoxville
• The Exascale Computing Project, an initiative of the US Department of Energy
• National Science Foundation
• Mellanox, Inc.
